Zeros of Polynomials	2845
Roots of a complex polynomial equation	2849
Roots of a real polynomial equation	2854
Roots of One or More Transcendental Equations	2860
Zero of a continuous function in a given interval	2864
Solution of a system of nonlinear equations	2868
Solution of a system of nonlinear equations	2872
Checks the gradients of a set of non-linear functions	2878
Discrete Fourier transform of real or complex data values	2881
Discrete Fourier transform of n real data values	2889
Discrete Fourier transform of a Hermitian sequence	2892
Discrete Fourier transform of n complex data values	2896
Circular convolution or correlation of two real vectors	2899
Discrete Fourier transforms of m sequences	2903
Discrete Fourier transforms of m Hermitian sequences	2908
Discrete Fourier transforms of m complex sequences	2912
Discrete Fourier transform of bivariate complex data	2916
Summation of Series	2921
Complex conjugate of a sequence of n data values	2923
Complex conjugates of m Hermitian sequences	2925
Form real and imaginary parts of m Hermitian sequences	2927
22.3 nagd.ht	2930
Quadrature	2930
Approximation of the integral over a finite interval	2943
Adaptive integration over a finite integral	2949
Approximate integration with local singular points	2955
Approximate integration over a (semi-)infinite interval	2961
Approximate sine or cosine transform over finite interval	2967
Adaptive integration of weighted function over an interval	2973
Hilbert transform over finite interval	2979
Approximate Sine or Cosine over $[a, \infty]$	2985
Weights and abscissae for Gaussian quadrature formula	2992
Multidimensional integrals with finite limits	2998
Third-order finite-difference integration	3003
Monte Carlo integration over hyper-rectangular regions	3006
Ordinary Differential Equations	3011
First-order ODE over an interval with initial conditions	3018
First-order ODE with initial conditions and user function	3026

First-order ODE with variable-order, variable-step	3034
Stiff First-order ODE with variable order and step	3043
Two-point boundary-value ODE	3052
Two-point boundary value ODE with deferred correction	3059
Eigenvalue of regular singular 2nd-order Sturm-Liouville	3067
Two-point boundary-value ODE equation systems	3090
Partial differential equations	3104
Discrete elliptic PDE on rectangular region	3111
Discrete 2nd-order elliptic PDE on rectangular regions	3119
Helmholtz equation in 3 dimensions	3132
22.4 nage.ht	3142
Interpolation	3142
Cubic spline interpolant	3147
Monotonicity-preserving piecewise cubic Hermite interpolant	3152
Piecewise cubic Hermite interpolant	3155
Piecewise cubic Hermite interpolant and 1st deriv	3158
Definite integral of piecewise cubic Hermite interpolant	3161
Bicubic spline interpolated surface	3163
Two-D surface interpolating a set of scattered data points	3170
Evaluate 2D interpolant function from E01SAF	3173
Generate 2D surface interpolating a scattered data points	3176
Evaluate 2D interpolating function from E01SEF	3182
Curve and Surface Fitting	3185
Least-squares polynomial approximations	3210
Evaluate polynomial from Chebyshev-series representation	3216
Constrained weighted least-squares polynomial	3220
Coefficients of polynomial derivative	3228
Find coefficients of indefinite integral of polynomial	3233
Evaluate polynomial in Chebyshev-series representation	3238
Weighted least-squares approx to data points	3243
Evaluates a cubic spline from its B-spline representation	3250
Evaluate cubic spline and 3 derivatives from B-spline	3254
Definite integral of cubic spline from B-spline	3259
Cubic spline approximation to an arbitrary set points	3263
Minimal, weighted least-squares bicubic spline fit	3272
Bicubic spline approximation to a set of data values	3281
Bicubic spline approximation to a set of scattered data	3292
Calculates values of a bicubic spline from B-spline	3304
Calculates values of a bicubic spline from B-spline	3308
Calculates l_1 solution to over-determined system equations	3312
Sorts two-dimensional data into rectangular panels	3318
Minimizing or Maximizing a Function	3322
Minimizes a nonlinear function of several variable	3347
Supply optional parameters to E04DGF from file	3362
Supply individual optional params to E04DGF	3365
Finding an unconstrained minimum of a sum of squares	3367

Finding an unconstrained minimum of a sum of squares	3373
Finding a minimum of a function	3380
Solving linear programming problems	3386
Solving linear or quadratic problems	3395
Minimize an arbitrary smooth constrained function	3415
Supply optional parameters to E04UCF from file	3466
Supply individual optional params to E04UCF	3469
Estimates of elements of the variance-covariance matrix	3472
22.5 nagf.ht	3478
Linear Algebra	3478
Matrix Factorization	3482
Factorizes a real sparse matrix	3485
Factorizes a real sparse matrix	3495
Incomplete Cholesky factorization	3501
Cholesky factor of a symmetric positive-definite matrix	3508
QR factorization of the real m by n matrix A	3513
$B := QB$ or $B := Q^T B$	3518
First ncolq columns of the real m by m orthogonal matrix	3523
QR factorization of the complex m by n matrix A	3527
$B := QB$ or $B := Q^H B$	3532
First ncolq columns of the complex m by m unitary matrix	3538
Eigenvalues and Eigenvectors	3543
Calculates all the eigenvalues of a real symmetric matrix	3549
Eigenvalues and eigenvectors of a real symmetric matrix	3551
Calculates all the eigenvalues of $Ax = \lambda Bx$	3554
Eigenvalues and eigenvectors of $Ax = \lambda Bx$	3557
Calculates all the eigenvalues of a real unsymmetric matrix	3561
Eigenvalues and eigenvectors of a real unsymmetric matrix	3563
Calculates all the eigenvalues of a complex matrix	3566
Eigenvalues and eigenvectors of a complex matrix	3569
Eigenvalues of a complex Hermitian matrix	3572
Eigenvalues/eigenvectors complex Hermitian matrix	3575
Eigenvalues and eigenvectors of a real symmetric matrix	3578
Eigenvalues of generalized eigenproblem $Ax = \lambda Bx$	3582
Eigenvalues and eigenvectors of real sparse symmetric problem	3586
Singular value decomposition of a general real matrix	3600
Singular value decomposition of a general complex matrix	3608
Simultaneous Linear Equations	3615
Approximate solution of a set of complex linear equations	3621
Approximate solution of a set of real linear equations	3624
Real symmetric positive-definite linear equations	3627
Set of real linear equations with a single right-hand side	3630
Solution of a set of real sparse linear equations	3634
Real symmetric positive-definite tridiagonal linear equations	3637
Solution of a linear least-squares problem, $Ax = b$	3642
Sparse symmetric positive-definite system linear equations	3648

Solves a system of real sparse symmetric linear equations	3655
Solution of a system of real linear equations	3666
Solves sparse unsymmetric equations	3671
Linear Algebra Support Routines	3685
Linear Equations (LAPACK)	3718
Computes the LU factorization of a real m by n matrix	3719
Solves a real system of linear equations	3722
Factorization of a real symmetric positive-definite matrix	3726
Real symmetric positive-definite system of linear equations	3730
Sort vector of double precision numbers	3737
Ranks a vector of double precision numbers	3740
Ranks the rows of a matrix of double precision numbers	3742
Ranks the columns of a matrix of double precision numbers	3745
Rearranges a vector of double precision numbers	3748
Inverts a permutation	3751
22.6 nags.ht	3754
Approximations of Special Functions	3754
Exponential function e^z , for complex z	3767
Returns the value of the exponential integral $E(x)$	3770
Returns the value of the cosine integral	3773
Returns the value of the sine integral	3776
Returns the value of the Gamma function	3779
Returns a value for the logarithm of the Gamma function	3782
Incomplete gamma functions $P(a,x)$ and $Q(a,x)$	3786
Returns the value of the complementary error function	3789
Returns the value of the error function erfx	3793
Returns the value of the Bessel Function $Y_0(x)$	3795
Returns the value of the Bessel Function $Y_1(x)$	3799
Returns the value of the Bessel Function $J_0(x)$	3804
Returns the value of the Bessel Function $J_1(x)$	3807
Returns a value for the Airy function, $Ai(x)$	3811
Returns a value of the Airy function, $Bi(x)$	3816
Value of the derivative of the Airy function $Ai(x)$	3820
Value for the derivative of the Airy function $Bi(x)$	3824
Values for the Bessel functions $Y_{\nu+n}(z)$	3828
Values for the Bessel functions $J_{\nu+n}(z)$	3833
Value of the Airy function $Ai(z)$ or derivative $Ai'(z)$	3838
Value of the Airy function $Bi(z)$ or derivative $Bi'(z)$	3842
Returns a sequence of values for the Hankel functions	3846
Returns the value of the modified Bessel Function $K_0(x)$	3852
Returns the value of the modified Bessel Function $K_1(x)$	3855
Returns the value of the modified Bessel Function $I_0(x)$	3859
Returns a value for the modified Bessel Function $I_1(x)$	3863
Sequence of values for the modified Bessel $K_{\nu_n}(z)$	3866
Sequence of values for the modified Bessel $I_{\nu+n}$	3871
Returns a value for the Kelvin function $\operatorname{ber} x$	3875

Returns a value for the Kelvin function $\text{bei } x$	3879
Returns a value for the Kelvin function $\text{ker } x$	3882
Returns a value for the Kelvin function keix	3886
Returns a value for the Fresnel Integral $S(x)$	3890
Returns a value for the Fresnel Integral $C(x)$	3894
Returns a value of an elementary integral	3898
Value of the symmetrised elliptic integral of first kind	3902
Value of the symmetrised elliptic integral of second kind	3906
Value of the symmetrised elliptic integral of third kind	3911
22.7 nagx.ht	3916
Mathematical Constants	3916
Machine Constants	3917
Input/Output Utilities	3924
Value of the current error message unit number	3926
Value of the current advisory message unit number	3928
Print a real matrix stored in a two-dimensional array	3931
Print a complex matrix stored in a 2D array	3934
Date and Time Utilities	3938
Returns the current date and time	3940
From seven-integer format time and date to character string	3941
Compares two date/time character strings	3944
Amount of processor time used	3947

New Foreword

On October 1, 2001 Axiom was withdrawn from the market and ended life as a commercial product. On September 3, 2002 Axiom was released under the Modified BSD license, including this document. On August 27, 2003 Axiom was released as free and open source software available for download from the Free Software Foundation's website, Savannah.

Work on Axiom has had the generous support of the Center for Algorithms and Interactive Scientific Computation (CAISS) at City College of New York. Special thanks go to Dr. Gilbert Baumslag for his support of the long term goal.

The online version of this documentation is roughly 1000 pages. In order to make printed versions we've broken it up into three volumes. The first volume is tutorial in nature. The second volume is for programmers. The third volume is reference material. We've also added a fourth volume for developers. All of these changes represent an experiment in print-on-demand delivery of documentation. Time will tell whether the experiment succeeded.

Axiom has been in existence for over thirty years. It is estimated to contain about three hundred man-years of research and has, as of September 3, 2003, 143 people listed in the credits. All of these people have contributed directly or indirectly to making Axiom available. Axiom is being passed to the next generation. I'm looking forward to future milestones.

With that in mind I've introduced the theme of the "30 year horizon". We must invent the tools that support the Computational Mathematician working 30 years from now. How will research be done when every bit of mathematical knowledge is online and instantly available? What happens when we scale Axiom by a factor of 100, giving us 1.1 million domains? How can we integrate theory with code? How will we integrate theorems and proofs of the mathematics with space-time complexity proofs and running code? What visualization tools are needed? How do we support the conceptual structures and semantics of mathematics in effective ways? How do we support results from the sciences? How do we teach the next generation to be effective Computational Mathematicians?

The "30 year horizon" is much nearer than it appears.

Tim Daly
CAISS, City College of New York

\begin{verbatim}
August 2014 release notes

This release moves Axiom to the latest GCL version.
All unused prior versions were removed.

Most of the work involved in this release has involved CATS,
```

working with Albert Rich to develop Axiom tests.

Noweb was removed. Axiom now uses its own literate tools.

The databases are no longer compressed.

Volume 13: Proving Axiom Correct was started

Makefile.pamphlet

- VERSION = August 2014
- TESTSET defaults to regresstests
- fix missing dvipdfm
- remove noweb

book/

- new directory containing axiom-developer emails
- reduce and categorize emails for history
- create timeline of people joining/leaving

books/

- axiom.sty
 - document
 - remove all other sources
 - add additional macros
- axbook.tgz
 - fix sinCosExpandRules
- dvipdfm.def
 - added
- tanglec.c
 - new C function to handle chunks
- tangle.lisp
 - add fastxhtml extraction from bookvol11
- extract (rename from document)
 - support new chunk syntax
- ps/
 - move .ps to .eps
 - add new images

books/Makefile

- handle bookheader.tex
- fix broken sed regular expression
- add bookvol13 (Proving Axiom Correct)

books/bookheader.tex

- user underline, colored links
- standardize headers, table of contents

books/bookvol0 (Jenks)

- add condata for MAGCDOC
- add graphics, fix typos, add text

```
books/bookvol1 (tutorial)
    use bookheader.tex
    fix typos

books/bookvol2 (users guide)
    use bookheader.tex
    add category theory chapter
    remove noweb

books/bookvol3 (programmers guide)
    use bookheader.tex
    remove noweb

books/bookvol4 (developers guide)
    use bookheader.tex
    section on changing GCL versions
    document makeHelpFiles
    remove autoload files
    remove noweb
    add HACKPI section

books/bookvol5 (interpreter)
    use bookheader.tex
    fix GETL for GCL
    add Attributes as Categories
    add Comparable
    add LeftOreRing
    add U32Matrix support macros
    add bc-matrix code
    add support code for U8Vector
    add support code for U32Vector
    add support code for U8Matrix
    add support code for U16Matrix
    add U32VectorPolynomialOperations
    expose FiniteFieldFactorization
    expose MAGCDOC
    expose MatrixManipulation
    rename functionp to canFuncall?
    incremental rewrite of br-con.lisp
    merge ht-util.lisp

books/bookvol6 (commands)
    use bookheader.tex

books/bookvol7 (hyperdoc)
    apply Camm's patches
    remove bibliography
    standardize the table of contents
    update credits
```

```
use bookheader.tex

books/bookvol17.1 (hyperdoc pages)
    standardize the table of contents
    update What's New Page
    update credits
    use bookheader.tex

books/bookvol18 (graphics)
    apply Camm's patches
    convert bookvol18 from noweb to chunks
    remove crc test cases
    standardize the table of contents
    update credits
    use bookheader.tex
    remove noweb

books/bookvol18.1 (graphics gallery)
    add CRC standard test cases, section 2.3-2.9

books/bookvol19 (compiler)
    use bookheader.tex
    functionp -> canFuncall?

books/bookvol10 (algebra implementation)
    absorb src/algebra/Makefile
    use bookheader.tex

books/bookvol10.1 (algebra theory)
    add interval arithmetic
    add section on interpolation formulas
    use bookheader.tex

books/bookvol10.2 (categories)
    AGG bug fixed 40355
    CLAGG bug fixed 40021
    MONAD bug fix 40350, add 7236
    ORDSET bug fix 40346
    PTRANFN bug fixed 40357
    REAL bug fix 40345
    add Attributes as Categories
    add Comparable
    add LeftOreRing
    add MAGCDOC
    add enumerate to FINITE
    add matrix initializer function
    fix failing test cases
    fix help documentation and regression tests
    use bookheader.tex
    write help documentation for all categories
```

FiniteSetAggregate subset? fixed
BinaryTreeCategory remove finiteAggregate, bug fix 7255

books/bookvol10.3 (domains)

AFFSP bug fix 30230, 20495; introduce 60076
BLAS1 bug fixed 40304
CHAR bug fix 40022
DFLOAT bug fix 20073, add 20570
DFLOAT bug fixed 40019
FPS bug fixed 40013
INBFF bug fixed 20465, add 20571
INTRVL bug fix 20480, 30143
ITAYLOR bug fix 20542 pretend
LIST bug fix 20063, add, add 20569
MLIFT bug fix 20001, add 20568
OPTPROB bug fix 40347
RNUMP removed bug fix 30047
SINT bug fix 20057 pretend
SMTS bug fix 20383, 50005, add 20567
SYMBOL bug fix 20056 pretend
add U16Matrix
add U16Vector
add U32Matrix
add U8Matrix
add U8Vector
add information to SingleInteger
SEXOF bug fix 20501
fix failing test cases
fix help documentation and regression tests
move EFULS EFUPXS from package to domain
update U32Vector domain
use bookheader.tex
write help documentation for all domains

books/bookvol10.4 (packages)

ATTREG bug fix 40362
ELTAB bug fix 40360
FSPECF bug fix 7235, 40077
GRAY bug fixed 20467
MAPPKG1 bug fix 40351
MSYSCMD bug fix 40359
SOLVERAD bug fix 40043
SREGSET bug fix 50001
add FiniteFieldFactorization
add MatrixManipulation, add Raoul Bourquin
add U32VectorPolynomialOperations
apply Waldek's changes to imposelc in PGCD
comment out bad code in GUESS
document htrigs function in TRMANIP
expand hyperbolic identities

```
bug fix "bad reduction" in multivariate poly gcd
bug fix ++X function example in gcd
bug fix OUT.spad warning (bug 329)
bug fix failing test cases
bug fix help documentation and regression tests
move EFULS EFUPXS from package to domain
use bookheader.tex
write help documentation
add reportInstantiations to API package

books/bookvol10.5 (numerics)
  add netlib cephes function covers
  use bookheader.tex

books/bookvol11 (browser)
  use bookheader.tex
  remove noweb

books/bookvol12 (crystal)
  remove noweb

books/bookvol13 (proving axiom correct)
  created

books/bookvolbib (bibliography)
  add references and abstracts
  add subsection Ore Rings
  add subsection Partial Fraction Decomposition
  add subsection Integration
  add subsection Expression Simplification
  add subsection Differential Equations
  add subsection Advanced Documentation
  add subsection Numerics
  add subsection Interval Arithmetic
  add subsection Proving Axiom Correct
  add subsection Category Theory
  add subsection Polynomial GCD
  add subsection Exponentiation Integral
  add subsection Special Functions
  add subsection Numerical Algorithms
  add subsection Solving Systems of Equations

buglist
  MLIFT fix 20001, add 20568
  AGG fixed 40355
  ATTREG fix 40362
  BLAS1 fixed 40304
  CHAR fix 40022
  CLAGG fixed 40021
  DFLQAT fix 20073, add 20570
```

DFLOAT fixed 40019
 ELTAB fix 40360
 FPS fixed 40013
 FSPECF fix 7235, 40077
 GRAY fixed 20467
 INBFF fixed 20465, add 20571
 INTRVL fix 20480, 30143
 ITAYLOR fix 20542 pretend
 LIST fix 20063, add, add 20569
 MAPPKG1 fix 40351
 MONAD fix 40350, add 7236
 MSYSCMD fix 40359
 OPTPROB fix 40347
 ORDSET fix 40346
 PTRANFN fixed 40357
 REAL fix 40345
 SINT fix 20057 pretend
 SMTS fix 20383, 50005, add 20567
 SOLVERAD fix 40043
 SREGSET fix 50001
 SYMBOL fix 20056 pretend
 fix bug 7072/19 $D(0^z, z)$ closed
 fix bug 7248: differentiation fix bug in $D(1, z)$
 fix bug 7249: radicalSolve($z^7=1, z$)
 fix bug 7249: radicalSolve($z^7=1, z$) update
 fix bug 7251: integrate($1/(1+z^4), z=0..1$) :: Complex Float
 fix bug 7252: argument($-\%i$)
 fix bug 7253: There are no library operations named 'when'
 fix bug 7254: $f=n \rightarrow \sum(\sum(1/i, i=1..j), j=1..n)$ complains
 fix bug 7256: $\text{acot}(-1)$ values differ
 fix bug 7257: normalize(subst(asin(z), $z=-1$)) division by zero
 fix bug 7258: $\text{acosh}(0.0)$ invalid argument to acosh
 fix bug 20501, SEXOF pretend, 30047 RNUMP
 fix bug 30230, 20495; introduce 60076
 fix bug 7236
 fix bug 329, add todo 330
 remove dead items
 remove error message for deleted files
 add 7142 $\exp^{\log(x)}$ Cannot take first of an empty list update
 add 7233: fill! operation from U8Vector does not show up
 add 7242/7243
 add 7244, 7245
 add bug 7241, fix the integration routines
 add bugs found in tests
 add kamke4, kamke6 missing bug
 add todo 335: add packages to)d op gcd
 add 7232
 wish 1011: $\sum(1/(k+a), k=1..n)$ by Gosper's method

March 2012 Release Notes

← “What’s New in Axiom” (releaseNotes) 1.1 on page 1
— **releasenotes.ht** —

```
\begin{page}{mar2012}{March 2012 Release Notes}
\beginscroll
\begin{verbatim}
March 2012 Release
```

A new volume, Volume 8.1, the Axiom Gallery shows examples of Axiom graphics. These are test cases being collected to show capabilities of the graphics subsystems.

One of the outstanding graphics bugs was 7217 which gave odd values for graphics labels. This was fixed by picking up Waldek’s patch for coercion to InputForm. This had the unfortunate side effect that a large number of Axiom’s 35,000 test cases needed to be updated.

A particularly interesting article on Literate Programming and Reproducible Research was published in the Journal of Statistical Software and was added to the documentation page.
(<http://www.jstatsoft.org/v46/i03/paper>)

There are two new commands, `)tangle` and `)regress`.

A new function, `getAncestors` was added to the API domain.

The buglist was published and several bugs were added.

New references to Axiom were added to the bibliography, including Dav12, Jen79, Dav80

Several people contributed to this release, including James Davenport, Mark Clements, George Legendre, and Waldek Hebisch

```
bookvol5.pamphlet

The Jenks book was updated by adding appendix E, and the
graphics images from the center of the book.

These people were added to the credits list:
Guilherme Reis, Michael Albaugh, Roger House to credits

Literate documentation was added to the book 9, the compiler
The axiomgraphs were created for the compile command and the parser.

The website was updated with several changes including a global
rewrite of the color and fixes for broken links.

Treeshaking of the compiler and interpreter code continues.

Work was done but not completed to move to GCL-2.6.8pre6

November 2011 Release
```

```
Treeshaking the interpreter and compiler continues and a few more files
were merged and removed.
```

```
Several books and Makefiles were converted to use lisp tangle rather
than noweb. This is part of the general process to remove noweb.
```

```
Global function rewrites continue, including removing GETREFV and makeprop.
```

```
Work was done to improve OpenMath support. The OpenMath semantics CDs were
added and the OpenMath parser was enhanced.
```

```
More effort was put into literate work. In particular, an example of a
literate program using HTML was created and presented at the Clojure/Conj
conference.
```

September 2011 Release
```

This release continues the task of treeshaking the compiler and interpreter. Nine files were merged and removed. In addition, several passes were made for code cleanup.

The Symbolic Ito Calculus package is being added, starting with the BasicStochasticDifferential and StochasticDifferential domains. More work remains to be done.

The GUESS package is being upgraded.

James Cloos and Wilfrid Kendall were added to the credits.

```
books/bookvol10.3
  add BasicStochasticDifferential and StochasticDifferential

```

This release involved more work treeshaking of the compiler and interpreter. Argument naming conventions were normalized to improve the documentation and clarity.

Time was spent proofreading the books and reducing or eliminating latex warnings. Missing index files were fixed and errors in the Jenks book were fixed.

The website has been updated to make Arthur Ralf’s book available from every page. The website is being rewritten to be IPv6 enabled.

Doug Telford was added to the credits.

```
Book Volume 0 (Jenks book)
proofread to chapter 1 (pdf page 86)
replace "operator over" by "operate over"
set textlength 400
port changes to Arthur Ralfs HTML version

September 2010 Release Notes

⇐ “What’s New in Axiom” (releaseNotes) [1.1](#) on page 1
 — **releasenotes.ht** —

```
\begin{page}{sept2010}{September 2010 Release Notes}
\beginscroll
\begin{verbatim}
September 2010 Release
```

This release concentrated on treeshaking the compiler code into book volume 9.
 Due to the complexity of this task it will take several releases to complete.

Additional global changes included collecting all of the Axiom-related
 latex macros into axiom.sty and removing references to Aldor.

Makefile

```
always run help extractions in parallel
build src/input quietly
```

```
books/bookvol0
remove references to aldor
```

```
books/bookvol1
remove references to aldor
```

```
books/bookvol5
expose StreamTensor, U32Vector, U32VectorPolynomialOperations
mark pure common lisp routines
merge ptrop, varini
move latex macros to axiom.sty
remove POLYVEC
remove compile, duplicated in vol9
remove memq
remove references to aldor
treeshake
remove $useNewParser
```

```
books/bookvol7.1
move latex macros to axiom.sty
remove references to aldor
rewrite \pagehead to \pagetitle
```

```
books/bookvol9

July 2010 Release Notes

← “What’s New in Axiom” (releaseNotes) [1.1](#) on page 1
— [releasenotes.ht](#) —

```
\begin{page}{july2010}{July 2010 Release Notes}
\beginscroll
\begin{verbatim}
July 2010 Release
```

This release concentrated on the work of Albert Rich and his Rubi pattern matching machinery. All of his integrals from his test suite were converted to a regression test suite. This will form a baseline for the pattern work in future releases. David Parnas has a table-based method of specifying programs. Axiom is trying to synthesize this work with the pattern match work to create pattern specifications using tables. Martin Baker added HTML output to the system. Waldek Hebisch implemented the DoubleFloat representation routines. Martin Rubey implemented Dirichlet.

The symbolic version of the fresnel integrals was added as well as a numeric implementation of the fresnelC and fresnelS functions. The output of these numeric functions were validated against Pearcy’s tables, with the comparison as part of the regression tests. Further work on numeric approximation is ongoing and expected in the next release.

These people were added to the credits list:

Albert D. Rich, David Parnas, Martin Baker

```
readme
  update credits list

Makefile
  add Mandriva
  fix environment variables
  segment test set choice from command line

books/axbook.tgz
  rewrite section 8.3.2 for current output

books/bookvol0
  rewrite section 8.3.2 for current output

books/bookvol10.2
  add fresnelS, fresnelC to LFCAT
  add test and help files for all categories

books/bookvol10.3
  add CDFMAT ComplexDoubleFloatMatrix
  add CDFVEC ComplexDoubleFloatVector
  add DIR Dirichlet
  add DFMAT DoubleFloatMatrix
  add DFVEC DoubleFloatVector
  add HTMLFORM HTMLFormat
  add fresnelS, fresnelC to EXPR

\begin{verbatim}
March 2010 Release

```

This release concentrated on treeshaking more code into the Interpreter

volume. Support for `)set break quit` was added. Additional documentation was added for branch cuts and clifford algebras. The first draft of a new volume (10.5) on Numerics was added. An example of unicode was tested to fulfill the long-term goal of unicode I/O support.

This release is an interim step in the process of merging the interpreter source code into a single volume. Due to the size and complexity of the task it will take several releases.

Three people were added to the credits list:
 John P. Fletcher <J.P.Fletcher@aston.ac.uk>
 Nathaniel Daly <nathaniel.daly@gmail.com>
 Ted Kosan <ted.kosan@gmail.com>

The Axiom website was completely rewritten based on a new style css provided by Nate. This change was also made to axiom-developer.com.

There is a new set option `")set break quit"` per Ralf Hemmecke. This will cause the interpreter to quit on failure. Documentation was added to the books.

books/bookvol4 Axiom Developers Guide
 add `)set break quit`

books/bookvol5 Axiom Interpreter
 add `)set break quit`
 add support for IndexedBits
 begin documentation of macex
 merge and remove lisp files from src/interp
 remove non-common lisp macros
 rewrite to common lisp functions

January 2010 Release

```

```

This release concentrated on treeshaking more code into the Interpreter
volume. Ten files have been merged and removed. Call graphs were generated
for all C code and added to the documentation. Several new functions were
added, including flush, machineFraction, and integerDecode.

```

This release is an interim step in the process of merging the interpreter source code into a single volume. Due to the size and complexity of the task it will take several releases.

Volume 0: Jenks

Lee Duhum fix typos

Volume 1: Tutorial

Lee Duham fix typos

Volume 5: Interpreter

)describe no longer needs cat, dom, pkg arg
 add Lee Duham to credits list
 add banner and cleanup globals
 add DoubleFloat trig macros
 support DFLOAT machineFraction, integerDecode
 do not set si::*system-directory* in restart
 fix)display all output bug
 merge fname.lisp, alql.lisp, i-syscmd, i-toplev, pathname.lisp
 merge daase.lisp, exposed.lsp

Volume 7: Hyperdoc

add call graph for ex2ht, htadd, hthits, hypertex, spadbuf

Volume 8: Graphics

add call graph for view2d, view3d, viewalone, viewman

Volume 10.2 Categories

latex cleanup
 FileCategory add flush

Volume 10.3 Domains

DoubleFloat add dfloat machineFraction, integerDecode
 DoubleFloat rewrite doublefloat to use typed macros
 File add flush

Volume 10.4 Packages

document RepeatedSquaring
 fix API regression

lsp/Makefile add compiler::link per Camm Maguire

src/algebra

remove exposed.lsp

src/axiom-website

add fedora 10 nov2009 build
 add nov2009 builds
 move CVS instruction to git
 axbook add Stack and Queue

```
axbook fix typos

src/input
  add ackerman to test function caching
  add dftrig to test DoubleFloat trig changes
  rewrite dfloat, dop, e1, ei, en, numericgamma using machineFraction
  r20bugs, setcmd, unittest1, unittest2 fix broken tests
  zimmbron fix typo in bibliography

src/interp
  remove alql, cformat, daase, fname, i-sysmcd, i-toplev, intfile,
    pathname, packtran

other src files
  add call graph information edible.c, asq.c
  src/doc/messages/s2-us.messages remove S2IZ0049D
  src/share/doc/messages/s2-us.messages removed

\end{verbatim}
\endscroll
\autobuttons

```

November 2009 Release Notes

← “What’s New in Axiom” (releaseNotes) [1.1](#) on page 1
— **releasenotes.ht** —

`\begin{page}{nov2009}{November 2009 Release Notes}`

`\begin{scroll}`

`\begin{verbatim}`

Summary: November 2009 release

The major changes are:

A new)describe command, boot language removal, and more motion toward a fully literate system.

The)describe command was added.

The)describe function was added to Volume 5 (Interpreter)

The)describe function was documented in Volume 2 (Users Guide)

The Description field for the Categories, Domains, and Packages

were cleanup up and reformatted in Volumes 10.2 (Categories)

10.3 (Domains) and 10.4 (Packages)

Boot Language removal

All of the boot-converted lisp files were reformatted from their compiler generated output. These files are being merged into Volume 5 (Interpreter) and Volume 9 (Compiler) as appropriate. This work will continue for the next few releases.

All or portions of the following files were merged into Volume 5 (Interpreter):

astr, cstream.lisp, dq, incl, int-top, i-syscmd, msg, nci, obey, osyscmd, parini, patches, pile, scan

The src/boot subdirectory is gone, including the files:

Makefile, boot-proclams, boothdr, bootload, btincl2, btpile2, btscan2, ccl-bootsys, ccl-depsys.lisp, exports.lisp, npextras, ptyout, tyextra, typars, typrops, tytree1, sys-pkg, vmlisp, ptrees, wi2

The bootsys image is no longer part of the build process

Patch ports from Fricas and Open-Axiom

The Tuples patch was picked up and applied.

The SXHASH function is the hash default in SetCategory

The function ListOfTerms was renamed to listOfTerms

Input file changes

New input files have been added to show how to compute results using Axiom or to create regression tests for fixes:
complexfactor, rubey, zimmbron, branchcut, cachedf, finitegraph, newtonlisp, nonlinhomodiffeq, distexpr, numericgamma, donsimpler solveperf, tuplebug, unit-macro, testprob, unittest2

lexp was removed and moved to the LEXP algebra file

dop and gstbl had minor fixes

New Help files and Function examples were added

There are new help files:

describe, AlgebraicallyClosedField, RationalFunctionSum, RadicalSolvePackage, PartialFractionPackage, Product, OrderedFreeMonoid

Website update:

The developer.html page was rewritten. An old Scratchpad group

photo was added to the site.

Work continues on re-hosting the axiom-developer.org domain.

We now own axiom-developer.com and axiom-developer.net which will be retargetted to the new host as soon as it is available

Interpreter changes:

Axiom will sit in a single package in the near future.
The VMLISP package was partially removed from the system.
Work continues on this path.

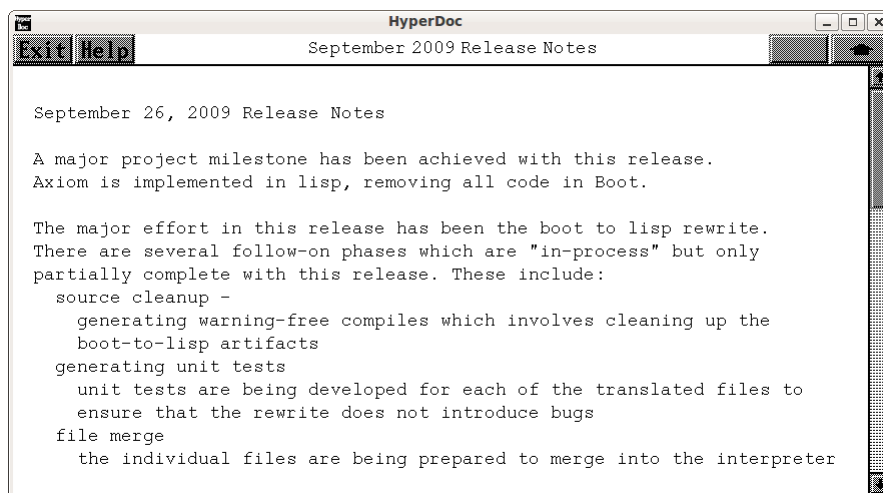

The util.ht file is created earlier in the parallel build
so there are fewer compiler messages about documentation.

Research:

A Cohen algebra domain is being developed to enable symbolic manipulation of expressions with explanations and controlled simplification.

September 2009 Release Notes

⇐ “What’s New in Axiom” (releaseNotes) 1.1 on page 1
 — releasenotes.ht —

```
\begin{page}{sept2009}{September 2009 Release Notes}
\beginscroll
\begin{verbatim}
September 26, 2009 Release Notes
```

A major project milestone has been achieved with this release.
 Axiom is implemented in lisp, removing all code in Boot.

The major effort in this release has been the boot to lisp rewrite.
 There are several follow-on phases which are "in-process" but only
 partially complete with this release. These include:

```
source cleanup -
    generating warning-free compiles which involves cleaning up the
    boot-to-lisp artifacts
generating unit tests
    unit tests are being developed for each of the translated files to
    ensure that the rewrite does not introduce bugs
file merge
    the individual files are being prepared to merge into the interpreter
    and compiler volumes.
global variable handling
    the system uses many globals which are being either explained or
    rewritten to reduce coupling
data structure extraction
    the various data structures used by the compiler and interpreter
    are being identified and explained
API vs implementation
    the functions used externally vs the functions used internally are
    being identified
code refactoring
    the generated lisp code is being rewritten into human form without
    changing the behavior
```

The target goal is to have the code cleanly merged into the interpreter
 and compiler volumes in a logical way that form chapters related to function.

Additional changes in this release include:

Add Steven Segletes to credits. He was the author of the paper that
 supplied the coefficients for computing E1. He has contributed a later,
 unpublished paper which has more accurate coefficients. This is in-plan
 to implement.

Barry Trager contributed an example of computing Shannon Matrices.
 This has been added to the input/regression suite.

The .dvi files for the interpreter are no longer being built. The individual pamphlets will shortly disappear.

Debugsys is no longer built. I am the only user of it and I can build it when needed.

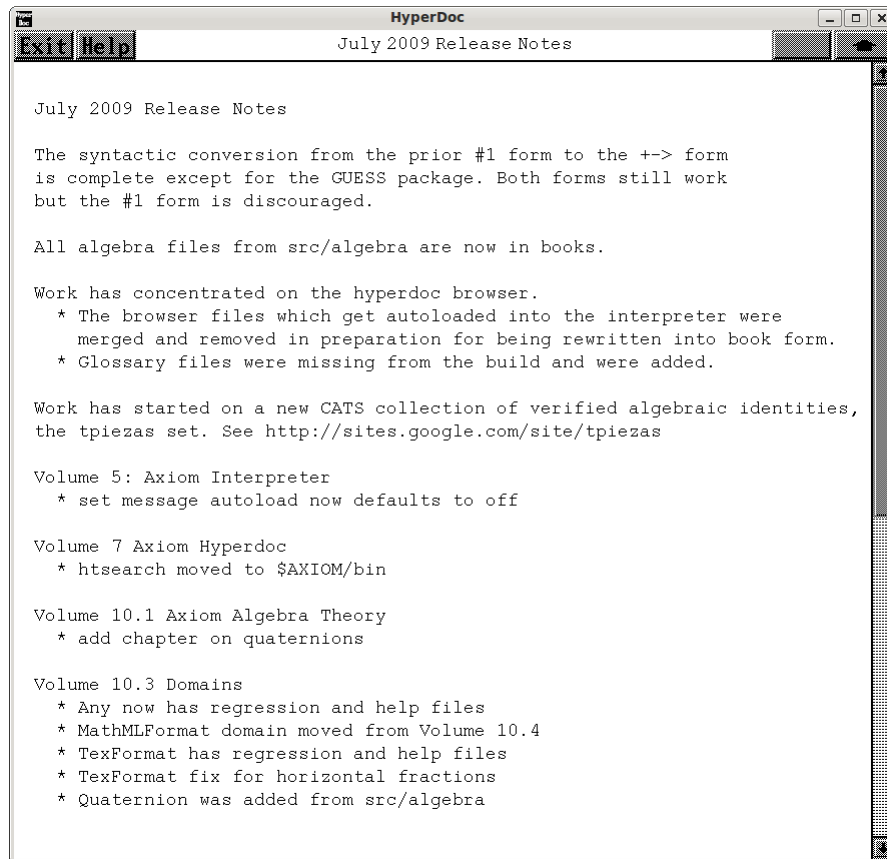

Bootsys is no longer built. It is no longer needed.

The Makefiles now use the := rather than = assignment limiting re-evals

Parallel Make is now the default since the documentation build is now independent of the interpreter build

```
\end{verbatim}  
\endscroll  
\autobuttons  
\end{page}
```

July 2009 Release Notes

← “What’s New in Axiom” (releaseNotes) 1.1 on page 1
— **releasenotes.ht** —

```
\begin{page}{july2009}{July 2009 Release Notes}
\beginscroll
\begin{verbatim}
July 2009 Release Notes
```

The syntactic conversion from the prior #1 form to the +-> form is complete except for the GUESS package. Both forms still work but the #1 form is discouraged.

All algebra files from src/algebra are now in books.

Work has concentrated on the hyperdoc browser.

- * The browser files which get autoloaded into the interpreter were merged and removed in preparation for being rewritten into book form.

- * Glossary files were missing from the build and were added.

Work has started on a new CATS collection of verified algebraic identities, the tpiezas set. See <http://sites.google.com/site/tpiezas>

Volume 5: Axiom Interpreter

- * set message autoload now defaults to off

Volume 7 Axiom Hyperdoc

- * htsearch moved to \$AXIOM/bin

Volume 10.1 Axiom Algebra Theory

- * add chapter on quaternions

Volume 10.3 Domains

- * Any now has regression and help files
- * MathMLFormat domain moved from Volume 10.4
- * TexFormat has regression and help files
- * TexFormat fix for horizontal fractions
- * Quaternion was added from src/algebra

Volume 10.4 Packages

- * IntegerNumberTheoryFunctions fix divisors regression
- * Waldek's QUATCT2 algebra was added, including a help file, regression tests and command examples.

Makefile

- * make help files in parallel
- * make xhtml pages in parallel
- * make books documentation in parallel

interpreter

- * src/interp/i-output.boot fix horizontal fractions

axiom-website

- * download.html add mandriva
- * download.html add may2009 binaries

input files

- * ffdemo.input fix steps 27, 57 due to divisors change
- * numbers.input fix random zero failure
- * spline.input explain how to compute 2D splines
- * tpiezas001.input CATS tests of algebraic identities
- * tpiezas002.input CATS tests of algebraic identities

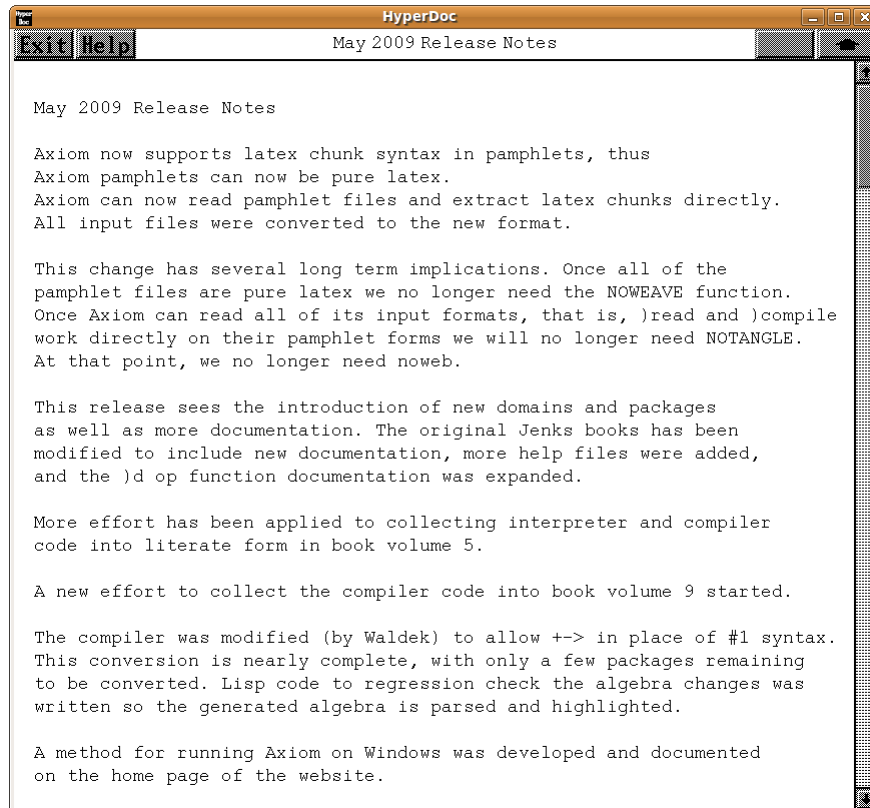

\end{verbatim}

\endscroll

\autobuttons

\end{page}

May 2009 Release Notes

⇐ “What’s New in Axiom” (releaseNotes) [1.1](#) on page [1](#)

```

```
\beginscroll
```

```
\begin{verbatim}
```

```
May 2009 Release Notes
```

```
Axiom now supports latex chunk syntax in pamphlets, thus
Axiom pamphlets can now be pure latex.
Axiom can now read pamphlet files and extract latex chunks directly.
All input files were converted to the new format.
```

```
This change has several long term implications. Once all of the
pamphlet files are pure latex we no longer need the NOWEAVE function.
Once Axiom can read all of its input formats, that is, )read and )compile
```

work directly on their pamphlet forms we will no longer need NOTANGLE.
At that point, we no longer need noweb.

This release sees the introduction of new domains and packages as well as more documentation. The original Jenks books has been modified to include new documentation, more help files were added, and the)d op function documentation was expanded.

More effort has been applied to collecting interpreter and compiler code into literate form in book volume 5.

A new effort to collect the compiler code into book volume 9 started.

The compiler was modified (by Waldek) to allow +-> in place of #1 syntax. This conversion is nearly complete, with only a few packages remaining to be converted. Lisp code to regression check the algebra changes was written so the generated algebra is parsed and highlighted.

A method for running Axiom on Windows was developed and documented on the home page of the website.

Unit testing of interpreter and compiler changes was added to the regression testing. This will expand in future versions as changes are made so ensure that things continue to function.

Volume 0: Axiom Jenks and Sutor

Richard Jenks bio was added

Section 9: Examples of Domains and Packages expanded

- ApplicationProgramInterface (API)
- Dequeue (DEQUEUE)
- EuclideanGroebnerBasisPackage
- GeneralDistributedMultivariatePolynomial
- GroebnerPackage
- HomogeneousDistributedMultivariatePolynomial
- NottinghamGroup
- Permutation
- RealSolvePackage
- TwoDimensionalViewport

Cross references were fixed

More spelling typo fixes

Volume 4: Axiom Developers Guide

A section was added explaining how to find anonymous function signatures

Volume 5: Axiom Interpreter

Michael Becker was added to the credit list

)set debug is now a new top level command to collect all of the developer-level commands to enable/disable internal messages and tracing functions.

\defunsec macro was added to handle section titles with docstrings

More interpreter code was moved from other files into this book

All regression test numbering was fixed to conform to the new, stronger regression test. Thus --S requires the "of NN" phrase or a FAILED message will be raised.

The compiler root was moved to volume 9: Axiom Compiler

Volume 7: Axiom Hyperdoc
Fixup verbatim breakage

Volume 7.1: Axiom Hyperdoc Pages
Update What's New for March 2009

Volume 9: Axiom Compiler
The compiler code is being collected from other parts of the system into this book. In particular,
The root functions for the compiler were added
The top level loop code of the compiler was added
The next layer of compiler code was added

Volume 10.2: Axiom Algebra Categories
There was a general change to allow +-> syntax in algebra and this was made to all existing categories

MatrixCategory now has regression test cases, a help page, and)d op function examples

Document binomial category

Volume 10.3: Axiom Algebra Domains
There was a general change to allow +-> syntax in algebra and this was made to all existing domains

SparseMultivariateTaylorSeries now has regression test cases, a help page, and)d op function examples

Permutation now has regression test cases, a help page, and)d op function examples

The regression tests now conform to the new, stronger regression test requirements

Volume 10.4: Axiom Algebra Packages

There was a general change to allow `+>` syntax in algebra and this was made to some existing packages. There is more to be done.

Bezier package was added, including regression test cases, a help page, and `)d op` function examples

CombinatorialFunction now has regression test cases, a help page, and `)d op` function examples

ElementaryFunction now has regression test cases, a help page, and `)d op` function examples

IntegerCombinatoricFunctions now has regression test cases, a help page, and `)d op` function examples

LazardSetSolvingPackage now has regression test cases, a help page, and `)d op` function examples

The regression tests now conform to the new, stronger regression test requirements

Volume 12: Axiom Crystal

Add Gelernter's observations on Layout and Linking

Bug fixes

7191: set <code>*system-directory*</code> dynamically	(20090413.03.tpd.patch)
7192: <code>)edit</code> now works because SPAEDIT added	(20090414.02.tpd.patch)
7197: fix hyperdoc/graphics failure	(20090530.01.tpd.patch)

Makefile changes

Top Level Makefile

- The BOOKS environment shell variable was added to ENV
- Makefile.slackware chunk exists
- Makefile reports regression failures after builds

lisp/Makefile

- Build tangle into the lisp image

src/Makefile

- Copy bookvol9, the compiler, to src/interp at build time

src/algebra/Makefile

- Add Bezier package
- Add LazardSetSolvingPackage.help
- Add MatrixCategory.input, .help
- Add help, regress for ElementaryFunction
- Add input, help, examples for SparseMultivariateTaylorSeries
- Fix LazardSetSolvingPackage typo
- Move `egrep` to `grep -E` since `egrep` might not be installed
- Move help to bookvol5

```

src/doc/Makefile
    Move help to bookvol5

src/input/Makefile
    Add FRAC regression test
    Add unittest* files for regression testing non-algebra changes
    Change input files to latex tangle
    Fix regress format to conform to the new, improved regression testing

src/interp/Makefile
    Build bookvol9, the compiler from book sources
    The old gclweb code was rewritten into tangle.lisp, gclweb was removed
    Move help to bookvol5
    More interpreter code was moved to bookvol5, the interpreter
    Debugsys has been updated to stop loading deleted files
    Several files were merged, rewritten, and removed:
        apply.boot, bootlex.lisp, comp.lisp, compiler.boot, cstream.boot,
        def.lisp, i-util.boot, incl.boot, int-top.boot, metalex.lisp,
        nci.lisp, parse.boot, parsing.lisp, postpar.boot, preparse.lisp,
        server.boot, setq.lisp, sockio.lisp, spad.lisp, spaderror.lisp,
        util.lisp, vmlisp.lisp

faq
    faq 50: Cannot find libXpm.a

readme
    Add Michael Becker to credit list

    tangle.lisp lisp version of tangle command
    ps/v71mar2009.ps hypertex march 2009 release notes pic
    ps/v71releasenotes.ps hypertex what's new page pic

src/interp
    Rewrite apply.boot to apply.lisp
    Regression tests, regress.lisp, now checks for the "of NN" phrase

src/algebra
    Add Bezier package to exposed.lsp

src/axiom-website
    Add March 2009 column
    Add slackware column
    Axiom on Windows as html instructions
    Add March release notes
    Add binaries

src/doc/

```

```

Add chunk environment to axiom.sty
Old book sources were removed
The spadhelp file was removed and added to the interpreter book

src/input/
  All of the .input files were modified to use latex tangle

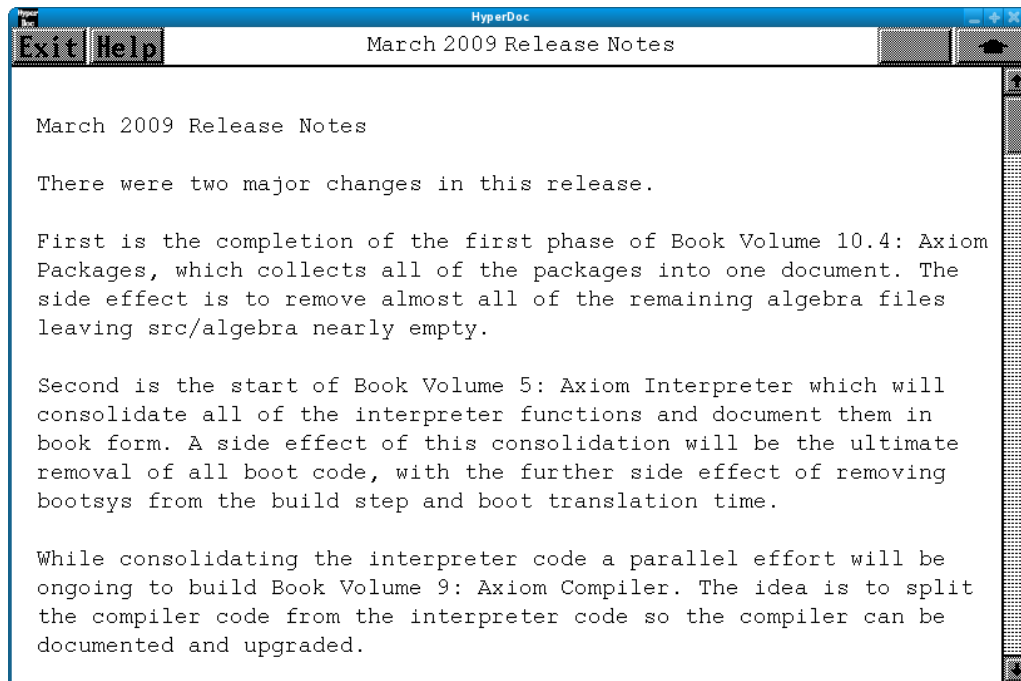

src/scripts/tex/
  axiom.sty contains new latex macros

zips
  Old GCL versions were removed
  gcl-2.6.8pre.tgz removed
  gcl-2.6.7.tgz removed

```
\begin{page}{mar2009}{March 2009 Release Notes}
\beginscroll
\begin{verbatim}
March 2009 Release Notes
```

There were two major changes in this release.

First is the completion of the first phase of Book Volume 10.4: Axiom Packages, which collects all of the packages into one document. The side effect is to remove almost all of the remaining algebra files leaving src/algebra nearly empty.

Second is the start of Book Volume 5: Axiom Interpreter which will consolidate all of the interpreter functions and document them in book form. A side effect of this consolidation will be the ultimate removal of all boot code, with the further side effect of removing bootsys from the build step and boot translation time.

While consolidating the interpreter code a parallel effort will be ongoing to build Book Volume 9: Axiom Compiler. The idea is to split the compiler code from the interpreter code so the compiler can be documented and upgraded.

Book Volume 0: Axiom Jenks book
Add)include documentation

The original book did not document the)include command. This is now documented.

Add UnivariateSkewPolynomial

This domain was added to the domain examples

Book Volume 4: Axiom Developers Guide
Hyperdoc

A Hyperdoc tutorial on making new pages was written

A tutorial on spadhelp was added

Book Volume 5: Axiom Interpreter
Command Handling

The top level commands that start with open parenthesis are all kept in the \$setOptions data structure. This structure was documented. Each command has a handler routine which was integrated with the

structure in the proper place.

New latex macros

The `\defun` and `\defmacro` macros were added to ensure that there is a uniform handling of subsections and cross references for all functions and macros.

The `\defdollar` macro was added to handle `$foo` variables in both index and cross reference.

The `\cmdhead` macro was added to provide uniform handling of each of the top level commands in the `$setOptions` data structure

Unit testing

To ensure that changes did not break behavior two new regression test routines were added, `unittest1` and `setcmd`. These test the top level command behavior.

Trace functions added

The `trace.boot` code was added.

Book Volume 7: Axiom Hyperdoc Documentation

Add Scott Morrison's original hypertext plan notes

Book Volume 10.1: Axiom Algebra Theory Documentation

Add tutorial chapter on Singular Value Decomposition

Book Volume 10.3 Axiom Domains Algebra fixes

Johannes Grabmeier fixed the `outputFixed` behavior in `Float`.

A regression test chunk was added to the `Float` domain.

`UnivariateSkewPolynomial` was documented. A regression test, help file, and examples were added.

`Heap` was documented. A regression test, help file, and examples were added.

`Dequeue` was documented. A regression test, help file, and examples were added.

Queue was documented. A regression test, help file, and examples were added.

ArrayStack was documented. A regression test, help file, and examples were added.

Stack was documented. A regression test, help file, and examples were added.

NottinghamGroup was added, including regression and help files. Originally written by Martin Rubey.

Regression tests

The `)sys rm` now uses the `-f` flag to force deletion on all regression test files

Book Volume 10.4 Axiom Packages

New Algebra

All packages were moved into this volume. Almost all of the remaining algebra files were deleted.

ApplicationProgramInterface (API) was added. It exposes the Axiom internal functions at the algebra level.

UnivariateSkewPolynomial now has help, input, and examples

Documentation

The nag man pages were added to the related domain documentation

Export lists were added for all packages.

Regression tests

The `)sys rm` now uses the `-f` flag to force deletion on all regression test files.

Boot to Lisp rewrite

Deleted boot files

setvars.boot is gone. The code has been rewritten and added to book volume 5. The code was rewritten and/or reformatted. All compile-time warnings were eliminated.

setvart.boot is gone. The code has been rewritten and added to book volume 5. The code was rewritten and/or reformatted. All compile-time warnings were eliminated.

trace.boot is gone. The code has been rewritten and added to book volume 5. The code was rewritten and/or reformatted. All compile-time warnings were eliminated.

Regression test

```
cleanup
)set break resume
```

A subtle bug in regression testing caused by early exit of a test left some of the regression tests reporting success when there should have been failure. This was fixed by adding a)set break resume command to allow Axiom to continue the testing in the presence of an internal fault.

new

setcmd.input was added to regression test changes to the)set top level command

unittest1.input was added to regression test other top level commands

dop.input was added to unit test)d op example output

frame.input was added to unit test frame handling

removed

bags.input was distributed among the algebra regression test files and bags.input was removed.

Bug fixes

Bug 7183. The library handling code was repaired. Functions which do not exist were removed (e.g. input-libraries). The element values of the data structure are now pathnames.

Bug 7182.)set mes auto did not indicate the current value.

Bug 7180:)set compiler input add foo triggers a call to open-library which was a CCL function and no longer implemented. The elements of the data structure were changed.

Bug 7179. Suprious sensitivity to)abb in documentation caused breakage because this was assumed to be an)abbreviation command.

Bug 7178. Missing function inspect in ArrayStack

Bug 7177. Missing function map! in ArrayStack

Bug 7176. Missing function parts in ArrayStack

Bug 7175. Missing function map in ArrayStack

Bug 7174. Missing function map! in Stack

Bug 7173. Missing function parts in Stack

Bug 7172. map was missing from Stack(Integer)

Bug 7170:)d op output failure due to X in algebra comments. The X symbol is now a marker for)d op examples and the use of X in comments is ambiguous.

Bug 7141:)cd relative does not work

Interpreter (src/interp)

Documentation

document mmCost calculation

Help files

Documentation

The help file list is now dynamically generated from the algebra books.

readme

Quote

Add Doron Zeilberger quote about builders of CA systems.

Website

Download

Add fedora10 as a supported platform

Add vector as a supported platform

Lisp

New patch

read-char-no-hang was changed by Camm to ignore newlines but Axiom's browser needs them to be recognized. A patch was added to back out Camm's change.

January 2009 Release Notes

⇐ “What’s New in Axiom” (releaseNotes) 1.1 on page 1
 — releasenotes.ht —

```
\begin{page}{jan2009}{January 2009 Release Notes}
\begin{scroll}
\begin{verbatim}
January 2009 Release Notes
```

One major theme of this release was restructuring the system
 to move all domains to literate form in book volume 10.3

A second major theme was the first Axiom youtube tutorial video.

Book Volume 0: Axiom Reference

Remove obsolete references to SmallFloat

Book Volume 1: Axiom Tutorial

Remove obsolete references to SmallFloat

Book Volume 4: Axiom Developers Guide

Add section on generating graphviz graphs

Book Volume 7.1: Axiom Hyperdoc

Give a complete path to htadd

Book Volume 10.3 Axiom Domains

All domains have been removed from the algebra subdirectory and are now in literate form in book volume 10.3. Some domains include a help file, a regression test suite, and --X function examples for the)display command. Future work will extend this set.

Each domain has a fully indexed list of functions exported. This allows hyperlinked access to functions.

Each domain includes a graph segment that shows the list of categories, domains, and packages that provide immediate support in the prior build layer.

Each domain includes a dotabb chunk which contains the source code necessary to recreate the graph.

Domains which were associated with other domains in the same original spad file have hyperlinks to connect them.

Book Volume 11: Axiom Browser

Lighten Bayou theme background image

Axiom Website (src/axiom-website)

The axiom website is now under git control.
The source tree is in src/axiom-website in the distribution.

The build order graph exists. It contains a graph of all the constraints for each level. A line in the graph connects each category, domain, and package to every category, domain, and package in the prior layer that is required for the build. Multilayer constraints are not shown (although the data is in src/algebra/Makefile chunks) because the graph would be too complex.

<http://axiom-developer.org/axiom-website/hp.svg>

The Computer Algebra Test Suite (CATS) has a new test suite for ordinary differential equations (kamke*)

<http://axiom-developer.org/axiom-website/CATS>

The Ubuntu download now advises `XTerm*metaSendsEscape: true` due to misconfiguration of the meta key in emacs.

<http://axiom-developer.org/axiom-website/documentation.html>

A new binary for vector linux was added

<http://axiom-developer.org/axiom-website/download.html>

A new binary for doyen thumbdrive was added

(work by Jose Alfredo Portes)

<http://axiom-developer.org/axiom-website/download.html>

The screenshots were recreated so the sources would be available. for `matrixinmatrix.jpg`, `heatequation.jpg`, `axiomfirefox.jpg`

<http://axiom-developer.org/axiom-website/screenshots.html>

The Axiom Information Sources video page was added, including a link to the youtube video, a local copy, and the supporting PDF.

<http://axiom-developer.org/axiom-website/videos.html>

A broken link to Book Volume 0: Axiom Reference was fixed.

Algebra (src/algebra)

All domains were removed from spad files and moved to Book Volume 10.3 Axiom Domains

The Makefile now contains the information necessary to construct the build order graph as literate chunks.

The layers were restructured. Files were moved to ensure that each file was at its lowest possible layer.

The Guess package was added. However, due to nonstandard package files the guess function does not yet work properly. These packages are being rewritten.

The Guess package has circular references. A new clique mechanism was added to the Makefile to handle this.

Automatic regression test files associated with the algebra sources were reviewed for conforming to regression standards.

`integer.spad` was reverted to remove an algebra change that causes a regression (cherry picked from Fricas in 2007)

Interpreter (src/interp)

Tim Lahey added to `)credits`

Karl Hegbloom added to)credits

htcheck.boot moves util.ht to the mnt/doc directory

setq.lisp no longer had redundant release data information

nrunfast.boot Float has exp : Float -> Float now works
This change was cherry-picked from Fricas.

Testing (src/input)

All regression test files were reviewed and cleaned to conform to a standard setup.

A parallel build race condition was fixed in the Makefile

xpbwpoly.input was removed as it is now associated with its source domain and automatically generated.

hyperbolicrules.input was added

Tim Lahey submitted a fix for bugs in schaum17.input

A cherry-picked patch from Fricas in 2007 was removed because it causes an algebra regression. The regression test file was corrected.

fixed.input was converted to a regression test file

Build process

The lsp/Makefile was updated for GCL pre3 patches

An ubuntu64 chunk was added as a system target

src/Makefile outputs util.ht before compiles (bug 7146)

books/Makefile uses bash SHELL to fix echo behavior.
The standard sh echo behaves badly.

books/Makefile now has amssymb in preamble for toc.tex

GCL (zips)

Axiom now includes GCL pre3, the latest snapshot of GCL.
This can be chosen as an option for building in the top level Makefile.pamphlet

The lsp/Makefile was updated for GCL pre3 patches

faq

FAQ 49: How do I get the latest GCL?

readme

Tim Lahey added
Karl Hegbloom added

The date information for releases was removed as it is
available elsewhere

A John Gorka quote was added:
"What matters the most is what you do for free" -- John Gorka

\begin{verbatim}
November 2008 Release Notes

Axiom website

New patch tracking has been added:
  * <http://axiom-developer.org/axiom-website/patches.html>

Volumes have been significantly updated:
  * <http://axiom-developer.org/axiom-website/bookvol10.2.pdf>
  * <http://axiom-developer.org/axiom-website/bookvol10.3.pdf>

Book Volume 10.2 Axiom Categories completed

The effort here is to create fully indexed, cross-referenced,
graphical documentation for Axiom categories in a standalone
form. This is a "live" literate document which contains the
actual source code used to build the system.

  * <http://axiom-developer.org/axiom-website/bookvol10.2.pdf>
```

Book Volume 10.3 Axiom Domains started

This volume will contain the Axiom domains.

* <<http://axiom-developer.org/axiom-website/bookvol10.3.pdf>>

Rosetta documentation

Fix the Magnus URL

Input Files

There is a new effort to automatically extract the algebra examples in order to regression test the user API to the algebra. In addition there is ongoing test work.

- * New input files (Jakubi, Maltey, Rubey, Page, Daly)
dhmatrix, reclos2
- * Changed input files (Hebisch, Daly)
sae, r20bugs

Build changes

- * Testing is now run in parallel

\end{verbatim}
\endscroll
\autobuttons
\end{page}

September 23, 2008 Release Notes

← “What’s New in Axiom” (releaseNotes) [1.1](#) on page 1
— **releasenotes.ht** —

```
\begin{page}{sept2008}{September 23, 2008 Release Notes}
\begin{scroll}
\begin{verbatim}
September 2008 Release Notes

Axiom website
  The effort here is to improve the support for offline literate
  documentation. The primary changes are the inclusion of graphs
  and additional book volumes.

* <http://axiom-developer.org/axiom-website/documentation.html>
  Contains the new algebra volumes and subvolumes.
* <http://axiom-developer.org/axiom-website/bookvol10.2abb.html>
  Contains a "clickable" graph that indexes into the algebra.

Graphviz, PDF, and HTML integration
  The effort here is to unify these three technologies in a way
  that simplifies the user interface and improves documentation
```

- * Graphviz is used if available but not required
- * Algebra graphs are automatically generated at build time from algebra source files
- * Graphviz graphs now properly hyperlink into PDF files allowing any node in a graph to link to any document page

Book volume 0 (Jenks and Sutor)

- * <http://axiom-developer.org/axiom-website/bookvol0.pdf>
- * replace `\over` with `\frac`

Book volume 7.1 (Hyperdoc pages)

The effort here is to create a literate document that contains all of the "live" pages used in hyperdoc. The PDF is being constructed so that a user can effectively "browse" the static hyperdoc pages, which are included, without a running Axiom.

- * <http://axiom-developer.org/axiom-website/bookvol7.1.pdf>
- * The source for all of the pages is now contained in this book.
- * Hyperdoc now fetches the pages directly from the book.
- * The hyper page directory and all files are gone.
- * Some of the static page images are now inside the PDF
- * Pages have href links allowing "in-pdf" navigation of pages

Book volume 10 (Algebra)

The effort here is to create a way to describe and deeply document the algebra. This volume was split to better handle the structure of Axiom's information.

- * Split into 5 volumes
 - 10 Implementation
 - 10.1 Theory
 - 10.2 Categories
 - 10.3 Domains
 - 10.4 Packages

Book volume 10.2 (Algebra Categories)

The effort here is to create fully indexed, cross-referenced, graphical documentation for Axiom categories in a standalone

form. This is a "live" literate document which contains the actual source code used to build the system.

- * <<http://axiom-developer.org/axiom-website/bookvol10.2.pdf>>
- * Contains 60 categories so far
- * Has partial graphs for each category
- * Has list of exported functions
- * Has information about source of functions
- * Has index cross reference by function and category
- * Has PDF href links so that URLs work:
 <<http://axiom-developer.org/axiom-website/bookvol10.2.pdf#nameddest=AGG>>
- * Has forward/backward links between categories
- * Automatically generates "clickable" graphs:
 <<http://axiom-developer.org/axiom-website/bookvol10.2abb.html>>
- * Graph clicking automatically opens to the proper source code

New algebra examples (Daly, Tsikas)

The effort here is to create "real time" documentation that gives the end user an example of how to construct the proper arguments and call a function. This puts examples into the system so users don't need to consult other documents.

- *)d op someop shows examples of function usage
- * about 100 new function examples were added
- * new comment syntax added to allow automatic API testing

Input Files

There is a new effort to automatically extract the algebra examples in order to regression test the user API to the algebra. In addition there is ongoing test work.

- * New input files (Hemmecke, Stumbo, Cyganski, Daly)
 bini, biquat, ifthenelse, liu, overload, sqrt3, typetower
- * Changed input files (Hemmecke, Stumbo, Cyganski, Daly)
 bern, function, linalg, regset, test, tutchap2

Build changes

- * graphics does not depend on compress, done at build time
- * firefox html pages are now built before tests are run

Algebra changes

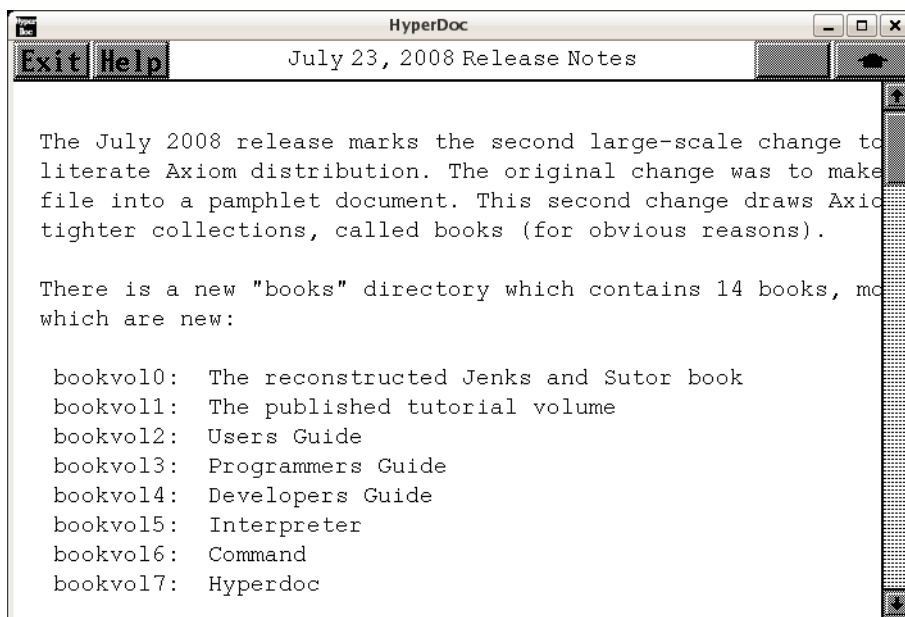

* FLAGG (FiniteLinearAggregate) -- removed a duplicate function

Interpreter changes (Page)

* add cost function to bottomUp output

July 23, 2008 Release Notes

⇐ "What's New in Axiom" (releaseNotes) [1.1](#) on page 1

— releasenotes.ht —

```
\begin{page}{july2008}{July 23, 2008 Release Notes}
\beginscroll
\begin{verbatim}
```

The July 2008 release marks the second large-scale change toward a literate Axiom distribution. The original change was to make every file into a pamphlet document. This second change draws Axiom into tighter collections, called books (for obvious reasons).

There is a new "books" directory which contains 14 books, most of which are new:

```
bookvol0: The reconstructed Jenks and Sutor book
bookvol1: The published tutorial volume
bookvol2: Users Guide
bookvol3: Programmers Guide
bookvol4: Developers Guide
bookvol5: Interpreter
bookvol6: Command
bookvol7: Hyperdoc
bookvol7.1 Hyperdoc Pages
bookvol8: Graphics
bookvol9: Compiler
bookvol10: Algebra
bookvol11: Browser
bookvol12: Crystal
```

All of these books now exist. Portions of the current system have been moved completely into book form (Graphics and Hyperdoc) so the old files have been removed from the src tree. Both Graphics and Hyperdoc are now built directly from their book. Work will follow on other parts of the system.

These books are online at:

```
<http://axiom.axiom-developer.org/axiom-website/documentation.html>
```

There is an interesting side-effect of using literate technology. Once you combine C and .h files into a single document so that each file is a separate chunk it becomes obvious that there is no need for local include files. The lines that read:

```
#include "foo.h"
become
begin{chunk}{foo.h}
```

and get expanded inline. Once you do this it also becomes obvious that many include files get included multiple times (a clear waste of disk I/O and parser time). Further it becomes clear that there

is no need for creating tiny .o files since all of the source can be combined into one C file using chunks.

These approaches were used to reduce the compile-time overhead for both the graphics and the hyperdoc functions.

In addition to consolidating the source files for Graphics into bookvol8 there were several other changes.

- * the functions for graphics, that is, viewman, view2d, view3d and viewalone are now built as single C files.
- * the graphics code was reorganized into chapters of related code
- * there is the beginnings of documentation
- * there is the beginnings of a test suite based on the CRC Handbook of Curves and Surfaces
- * the book is hyperlinked (Bill Page, Frederic Lehouby, Anatoly Raportirenko)
- * redundant code was eliminated
- * the code is fully indexed
- * the src/graph subdirectory is gone

In addition to consolidating the source files for Hyperdoc into bookvol7 there were several other changes.

- * the functions for hyperdoc, that is, spadbuf, ex2ht, htadd, hthits and hypertex are now built as single C files
- * the hyperdoc code was reorganized into chapters of related code
- * there is the beginnings of documentation
- * redundant code was eliminated
- * scroll wheel handling was added (Gregory Vanuxem)
- * the book is hyperlinked (Bill Page, Frederic Lehouby, Anatoly Raportirenko)
- * the code is fully indexed
- *)hd now works to start or restart Hyperdoc (Jose Alfredo Portes)
- * the src/hyper subdirectory is gone

In addition to consolidating the hyperdoc pages into bookvol7.1 there were several other changes:

- * the pages are hyperlinked
- * new latex macros were written to simplify page handling
- * images of hyperdoc pages were added
- * forward and backward hyperlinks between pages images works making it possible to "browse" the hyperdoc pages using only the single PDF file (Bill Page, Frederic Lehouby, Anatoly Raportirenko)

- * the pages are fully indexed
- * the src/hyper/pages subdirectory is gone

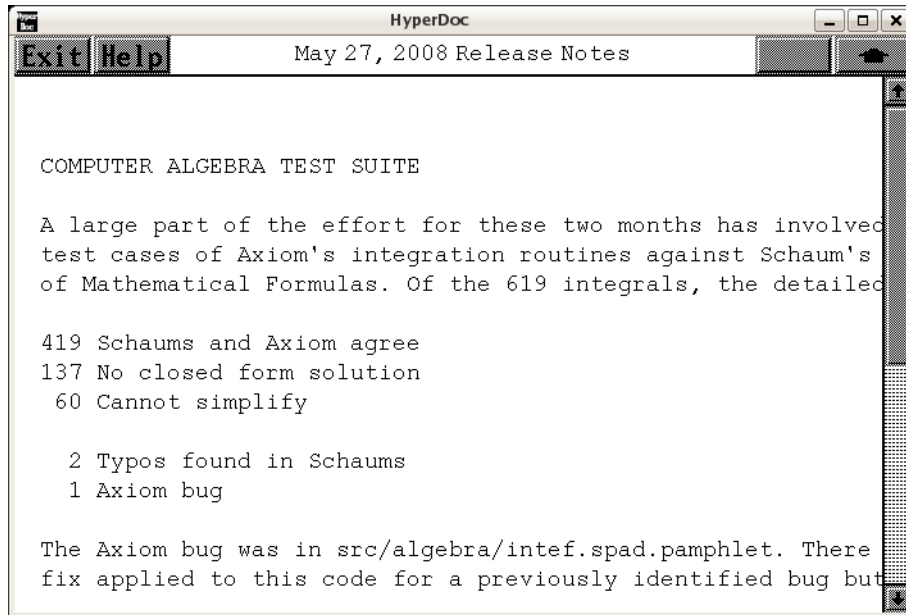

A combined table of contents PDF is now automatically generated which covers all of the volumes. This makes it easier to find the topic of interest.

In addition there were several other changes.

- * Some fixes were made for different platforms
In particular, Fedora9 breaks the build and needs work
- * The configure script was replaced by instructions
The standard (export AXIOM) works everywhere so the configure script is useless for guessing.
- * the FAQ was updated about git
Since the May 2008 release the primary Gold source code platform is github. The FAQ was updated to reflect this.
- * the FAQ was updated about X11
X11 has moved yet again so more notes are needed
- * move axbook to books
The hyperlinked version of Jenks is now built from the books dir
- * add Ralf Hemmecke's documentation to ax.boot
- * add Monoid multiply to DirectProduct (Ralf Hemmecke)
- * add Monoid multiply regression test

COMPUTER ALGEBRA TEST SUITE

A large part of the effort for these two months has involved detailed test cases of Axiom’s integration routines against Schaum’s Handbook of Mathematical Formulas. Of the 619 integrals, the detailed results are:

419 Schaums and Axiom agree
 137 No closed form solution
 60 Cannot simplify

2 Typos found in Schaums
 1 Axiom bug

The Axiom bug was in src/algebra/intef.spad.pamphlet. There was a fix applied to this code for a previously identified bug but the previous fix was incorrect.

In addition, there were

```
src/input/danzwill12.input.pamphlet added for the MIT Integration tests
src/input/mapleok.input.pamphlet to fix typos
src/input/kamke1.input.pamphlet had ode97 removed due to running time
src/input/kamke2.input.pamphlet ode104, ode105 removed for running time
```

Summary: March 2008 release

Axiom is now available at github, a git-based code repository. This site will have the Gold version of Axiom, that is, only code that changes at each two-month release. To get a clone type:

```
git-clone git://github.com/daly/axiom.git
```

USER VISIBLE CHANGES

One primary focus of this release has been extending the Firefox toward being a full Axiom user interface (as opposed to a simple hyperdoc replacement). The Firefox console page has new, AJAX based, dropdown menus which are planned to be dynamically updated to display available functions for the last computed type. This should make it much easier to find the applicable functions by category and type. They are currently static in this release.

* Firefox Pages

- o Dropdown menus were added to the Axiom console page
- o More hyperdoc pages were translated to Firefox/html
- o Bitmaps and graphics are now properly handled in pages
- o A minor mathml fix was applied (for invisible times)

* Refcard

- o An Axiom reference card of Axiom commands was created (src/doc/refcard)

* Examples

- o It is often difficult to figure the exact arguments required to call any given function in Axiom. The `)display operation` command used to only show the available modemap. This command has now been changed. `)display operation foo` now shows examples of function calls for foo.

* Help

- o The plot routines have new help files and documentation

PORTING

- o Axiom was ported to MAC-OSX
- o The binary download page now has binaries for Ubuntu, OpenSUSE, Redhat9, Redhat72, Debian, MACOSX at

<<http://axiom.axiom-developer.org/axiom-website/download.html>>

- o Binaries for the this release will be available shortly.

INTERNALS

* Compiler changes

- o hashtables were used to speed up compiles

* Algebra changes

- o There are new special functions, Ei,En,Ei1,Ei2,Ei3,Ei4,Ei5,Ei6
- o The prime and BasicSieve functions are faster
- o The Brent/Pollard algorithm was documented
- o Bad gcd reductions are checked (heugcd regression test file added)
- o The plot routines have new help files and documentation

* Makefile changes

- o Bi-capital SVN copies are no longer made

* Interpreter changes

- o Book Volume 5 has new documentation on the display function
- o The display function code has been translated and moved to book volume 5
- o PI has a higher internal precision
- o Mappings are now properly hashed for Aldor

CATS (Computer Algebra Test Suite)

- o The differential equations regression tests are being checked against Mathematica, Maple, and Maxima. This has happended for the kamke2.input regression test file and will happen for the other regression tests.
- o Complex Gamma, logGamma, and log(Gamma) have additional tests and documentation.

\end{verbatim}

January 25, 2008 Release Notes

← “What’s New in Axiom” (releaseNotes) [1.1](#) on page 1
— **releasenotes.ht** —

```
\begin{page}{january2008}{January 25, 2008 Release Notes}
\begin{scroll}
\begin{verbatim}
```

Summary: January 2008 release

There have been two major concentrations of effort in this release.

The first concentration is on the new Firefox Hyperdoc and the second concentration was the verification of Axiom against published standards.

Firefox Hyperdoc

The Firefox Hyperdoc has been integrated with the rest of the interpreter. The new)browse command causes Axiom to listen and serve hyperdoc pages on port 8085.

The interpreter was changed to add the)browse command. As a

side-effect new documentation was added to the interpreter volume (bookvol5) to explain top-level command handling. In addition, lisp and boot code was rewritten as part of the literate change.

New sections were added to cover the beginning of the Computer Algebra Test Suite (CATS) subsection which brings a focus on compliance with published standards.

Arthur Ralf's mathml-enabled version of the Jenks book is fully integrated into the Firefox Hyperdoc. Arthur also fixed some rendering and ambiguity issues.

axbook.tgz	fix the user/group settings
axserver.spad	fix lastType output re: errors
bookvol5	browse and top-level command handling
bookvol11	add standards compliance for gamma
gammacomplexinverse.png	added
gammacomplex.png	added
gammareal3.png	added
loggamma.png	added
mathml.spad	fix ambiguity bug in mathml output
mathml.spad	fix hex(10) mathml rendering
mathml.spad	fix F,3 mathml rendering
mathml.spad	remove code to eat %%
psi.png	added

Standards Verification

The Computer Algebra Test Suite (CATS) effort checks the results that Axiom generates against published results. Axiom has an extensive set of regression tests (the KAMKE suite) for ordinary differential equations, for integration (the SCHAUM suite), and for numeric special functions (the ABRAMOWITZ suite). In addition, results have been checked against Mathematica, Maple, and Maxima.

asinatan.input	regression for the functions asin and atan
asinhatanh.input	regression for the functions asinh and atanh
besselk.input	regression for the function besselK
e1.input	regression for the function E1
en.input	regression for the function En
exp.input	regression for the function exp
gamma.input	regression for the function gamma
log.input	regression for the functions log
pfaffian.input	regression for the function pfaffian
seccsc.input	regression for the functions sec and csc
sincos.input	regression for the functions sin and cos

<code>sinhcosh.input</code>	regression for the functions <code>sinh</code> and <code>cosh</code>
<code>tancot.input</code>	regression for the functions <code>tan</code> and <code>cot</code>
<code>tanhcoth.input</code>	regression for the functions <code>tanh</code> and <code>coth</code>

New Functions Added

Axiom is missing various special functions found in other computer algebra systems. This release adds two new ones, the Exponential Integral `E1` and the higher order Exponential Integral `En`. These have been tested against the published results.

```
special.spad E1 added
special.spad En added
```

Bugs Fixed

There are 15 bug fixes in this release:

```
bug 7015: fix hex(10) mathml rendering
bug 7016: remove code to eat %%
bug 7019: fix F,3 mathml rendering
bug 7023: discardGraph free corrected
bug 7042: ignore regression test gensym
bug 7045: wrong Makefile for Xpm fix
bug 7052: spurious remake of axbook
bug 7054: /home/silver path in bookvol11
bug 7057: ambiguity in mathml
bug 7089/343: FreeAbelianGroup order
bug 7090/355 handle bessellK
bug 7093: Function name fix
bug 7100/149: numlock in hyperdoc
bug 7101/204: MoreSystemCommand unnecessary loading
bug 7102/412: Equality testing in TableAggregate
```

Regression test fixes

As changes happen in the system the regression tests are updated to reflect the new conditions. Changing the category of `PositiveInteger` caused `(a + -bi)` to print as `(a - bi)`. New builds raised gensym faults which were fixed. And new builds change random numbers so the tests that depend on them are marked "ok" despite failures due to randomness.

The FreeAbelianGroup bug is tested.

acplot.spad	fix output form of negative numbers
calculus2.input	fix function names
classtalk.input	ignore gensyms
collect.input	fix function names
dfloat.input	handle negative number output
easter.input	fix function names
elemnum.input	handle negative number output
exlap.input	fix function names
exsum.input	fix function names
free.input	added to test bug
grpthy.input	mark random generation failures ok
grpthy.input	fix function names
ico.input	mark random generation failures ok
intg0.input	ignore gensyms
is.input	type declare function
kamke3.input	mark random generation failures ok
knot2.input	fix function names
lodo.spad	ignore regression test gensym
mapleok.input	ignore gensyms
mathml.input	handle new mathml sub/sup change
ndftip.input	fix missing blank lines
pmint.input	rewritten
repa6.input	fix function names
r20bugs.input	change spacing
sf.spad	fix output form of negative numbers
tbagg.input	regression for equality testing in TableAggregate

Algebra file changes

The fundamental change was a supposedly transparent move of the category for PositiveInteger. This had the effect of changing the output form and broke several regression tests. Some mathml issues were fixed. The new functions E1 and En were added. The FreeAbelianGroup bug was fixed.

axserver.spad	fix lastType output re: errors
acplot.spad	fix output form of negative numbers
combfunc.spad	fix bold font handling
integer.spad	category change for PositiveInteger
sf.spad	fix output form of negative numbers
sf.spad	handle bessellK
op.spad	handle bessellK
combfunc.spad	handle bessellK
free.spad	fix FreeAbelianGroup bug
special.spad	add E1

```

special.spad  add En
mathml.spad   fix ambiguity bug in mathml output
mathml.spad   fix hex(10) mathml rendering
mathml.spad   fix F,3 mathml rendering
mathml.spad   remove code to eat %%

```

Interpreter changes

The primary changes are the addition of bookvol11 for the Firefox Hyperdoc and the literate documentation of the top level command handling in bookvol5 (the interpreter) along with rewrites of the lisp/boot code.

```

bootfuns.lisp move $systemCommands to bookvol5
bookvol5      browse and top-level command handling
bookvol11     added
http.lisp     mathObject2String for hex(10)
incl.boot     move incBiteOff to bookvol5
intint.lisp   move setCurrentLine to bookvol5
int-top.boot  move ncloopCommand, etc. to bookvol5
i-syscmd.boot move $SYSCOMMANDS to bookvol5
Makefile      wrong Makefile for Xpm fix
makegraph.c   discardGraph free corrected
nci.lisp      move ncloopInclude to bookvol5
setq.lisp     move command initialization to bookvol5

```

Documentation changes

```

bookvol5      explain top level input handling (lisp/boot rewrite)
combfunc.spad fix bold font handling
axiom.sty     add binom

```

Summary: November 2007 release

All of the golden sources are up to date.

- savannah.nongnu.org/projects/axiom CVS
- sourceforge.net/projects/axiom CVS
- arch@axiom-developer.org ARCH (axiom--main--1--patch-54)
- git@axiom-developer.org GIT

ADD NEW CREDITS

New patches were posted by Arthur and Alfredo so their tlas were added to the changelog

20071001 acr Arthur C. Ralfs <arthur@mathbrane.ca>
 20070914 jap Jose Alfredo Portes <doyenatccny@gmail.com>

PORT TO DIFFERENT SYSTEMS

As part of the new axiom website there is a binary release page.
The stanzas for these supported systems were added.

20071119 tpd Makefile.pamphlet add fedora6,7,8 stanzas

NEW Axiom WEBSITE: <http://axiom-developer.org> STARTED.
The new Axiom website (currently at axiom.axiom-developer.org)
has been started. It will include the binary release page.

REMOVE OLD REGRESSION SYSTEM

The previous regression test system was removed. A new combined
regression test and help documentation system was built to replace
this mechanism.

20070901 tpd src/input/Makefile remove ALGEBRA variable
20070901 tpd src/algebra/perm.spad remove TEST mechanism
20070901 tpd src/algebra/view2d.spad remove TEST mechanism
20070901 tpd src/algebra/fr.spad remove TEST mechanism

FIX BOOK DOCUMENTATION

Minor typos have been discovered in the book during documentation.

20070905 tpd src/doc/book remove duplicate upperCase, lowerCase typo
20070903 tpd src/doc/bookvol4 fix typos
20070902 tpd src/doc/book MultiSet -> Multiset
20080829 tpd src/doc/book.pamphlet correct typo

FIX BUGS

Various bugs have been found and fixed.

20071101 tpd src/interp/i-output.boot fix bugs 7010 (209), 7011
20070920 tpd src/input/Makefile add bug101.input regression test
20070920 tpd src/input/bug101.input test laplace(log(z),z,w) bug 101
20070920 wxh src/algebra/laplace.spad fix laplace(log(z),z,w) bug 101
20070916 tpd src/input/Makefile add bug103.input regression test
20070916 tpd src/input/bug103.input test solve(z=z,z) bug fix
20070916 tpd src/algebra/polycat.spad solve(z=z,z) bug fix
20070916 tpd src/algebra/catdef.spad add zero? to exquo
20070915 tpd merge bug100 branch
20070915 tpd src/input/Makefile add bug100.input regression test
20070915 tpd src/input/bug100.input test integrate((z^a+1)^b,z) infinite loop
20070915 wxh src/algebra/intef.spad fix integrate((z^a+1)^b,z) infinite loop
20070915 tpd src/algebra/carten minor edit for regression cleanup
20070914 wxh src/hyper/hyper fix bad bracing of)hd change
20070914 tpd src/algebra/fraction.spad remove double)spool command
20070914 tpd src/algebra/kl.spad remove double)spool command

20070914 tpd src/algebra/lindep.spad remove double)spool command
 20070914 tpd src/algebra/radix.spad remove double)spool command

ENABLE DYNAMIC RESTART OF HYPERDOC

Hyperdoc can now be started dynamically or restarted if killed.

20070914 jap adapt changes for)hd restart to Axiom sources
 20070914 wxh src/sman/bookvol6 enable restart of hyperdoc with)hd
 20070914 wxh src/include/sman.h1 enable restart of hyperdoc with)hd
 20070914 wxh src/hyper/hyper enable restart of hyperdoc with)hd

SET UP THE NEW FIREFOX BASED HYPERDOC

Hyperdoc is going away. A new version of hyperdoc is being built which uses html/javascript/mathml. These files change the interpreter and algebra to support the new hyperdoc machinery.

20071019 acr src/interp/http.lisp use new return values
 20071019 acr src/algebra/axserver.spad use new return values
 20071014 acr src/algebra/axserver.spad use getContentType(pathvar)
 20071013 acr license/license.ralfs license rewrite
 20071013 acr src/interp/http.lisp faster page service
 20071013 acr src/algebra/axserver.spad faster page service
 20071001 tpd src/algebra/exposed.lisp add (|AxiomServer| . AXSERV) to basic
 20071001 tpd src/algebra/Makefile add axserver.spad
 20071001 acr src/algebra/axserver.spad axserver socket connection code
 20071001 tpd src/interp/Makefile add http.lisp
 20071001 acr src/interp/http.lisp axserver socket connection code
 20071001 acr license/license.ralfs added

REGRESSION TEST CALCULUS

A new regression test suite for calculus is being built. The first of these files has been added to the system.

20070913 tpd src/input/Makefile schaum1.input added
 20070913 tpd src/input/schaum1.input added

REGRESSION TEST ORDINARY DIFFERENTIAL EQUATIONS

A regression test suite for ordinary differential equations was built.

20071005 tpd src/input/Makefile kamke7.input regression test added
 20071005 tpd src/input/kamke7.input ODE regression test added
 20071005 tpd src/input/Makefile kamke6.input regression test added
 20071005 tpd src/input/kamke6.input ODE regression test added
 20071005 tpd src/input/Makefile kamke5.input regression test added
 20071005 tpd src/input/kamke5.input ODE regression test added
 20071005 tpd src/input/Makefile kamke4.input regression test added

20071005 tpd src/input/kamke4.input ODE regression test added
 20071005 tpd src/input/Makefile kamke3.input regression test added
 20071005 tpd src/input/kamke3.input ODE regression test added
 20071004 tpd src/input/Makefile kamke2.input regression test added
 20071004 tpd src/input/kamke2.input ODE regression test added
 20071004 tpd src/input/Makefile kamke1.input regression test added
 20071004 tpd src/input/kamke1.input ODE regression test added
 20071004 tpd src/input/Makefile kamke0.input regression test added
 20071004 tpd src/input/kamke0.input ODE regression test added

REGRESSION TEST PFAFFIAN

Martin added the pfaffian regression test. It was added and removed due to documentation license issues. New documentation is being written.

20070929 tpd src/input/Makefile pfaffian regression test removed
 20070929 tpd src/input/pfaffian.input regression test removed
 20070927 tpd src/input/Makefile pfaffian regression test added
 20070927 mxr src/input/pfaffian.input regression test added

ADD PORTIONS OF THE GUESS PACKAGE

The newton.spad file is actually part of the fffg.spad file so it was removed. The very top level spad functions in GUESS still do not work properly.

20070909 tpd src/algebra/newton.spad included in fffg.spad
 20070909 tpd src/algebra/Makefile remove newton.spad (duplicate)

FIX BUILD PROCESS

The build process was not properly suppressing output by default.

20070907 tpd src/algebra/acplot.spad fix PlaneAlgebraicCurvePlot.help NOISE
 20070907 tpd src/algebra/Makefile make regression respect NOISE variable
 20070907 tpd src/input/Makefile make regression respect NOISE variable

FIX INSTALL PROCESS

The install process had a bug.

20070906 tpd Makefile int/sman/axiom command to target command for install
 20070906 tpd src/sman/Makefile copy axiom command to int

ADD ALDOR RELEASE

The aldor release has been added to zips. It will soon be part of the build mechanism but separately maintained like GCL.

20070901 tpd zips/aldor.20070901.tgz add pdf documentation

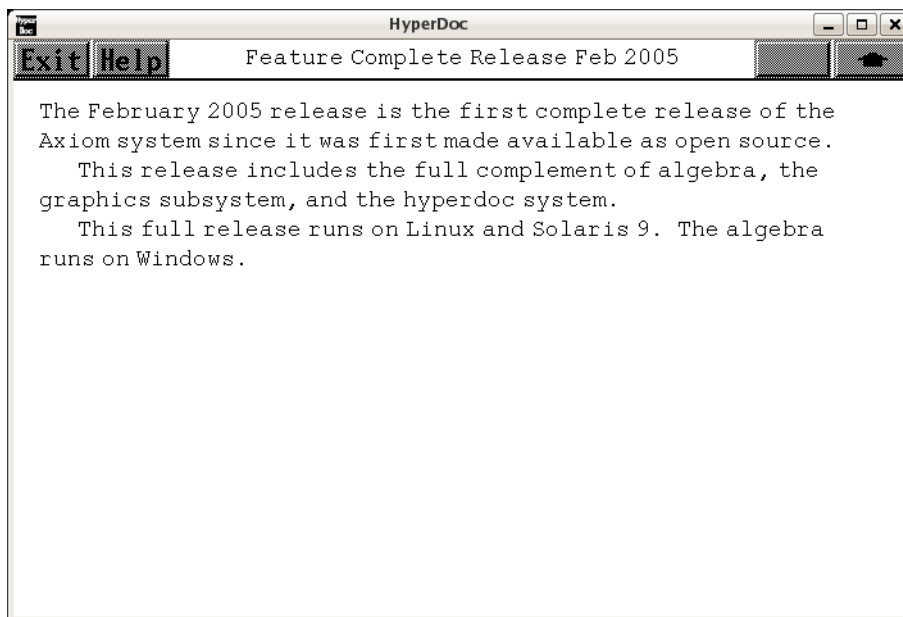

20070901 tpd zips/aldor.20070901.tgz added

ADD)HELP FACILITY

The)help facility was recovered. The documentation is now integrated into the spad files and used both for help documentation and algebra regression testing.

Feature Complete Release Feb 2005

← “What’s New in Axiom” (releaseNotes) [1.1](#) on page [1](#)
— **releasenotes.ht** —

```
\begin{page}{feb2005}{Feature Complete Release Feb 2005}
\beginscroll
The February 2005 release is the first complete release of the
Axiom system since it was first made available as open source.
```

This release includes the full complement of algebra, the graphics subsystem, and the hyperdoc system.

This full release runs on Linux and Solaris 9.

The algebra runs on Windows.

\end{page}

Chapter 2

Special hyperdoc pages

2.1 util.ht

This file contains macros for the Axiom HyperDoc hypertext facility. Most of the macros for the system are here though there may be some in individual .ht files that are of a local nature.

Names of software and facilities

— util.ht —

```
\newcommand{\Browse}{Browse}
\newcommand{\Language}{Axiom}
\newcommand{\SpadName}{\Language}
\newcommand{\LangName}{\Language}
\newcommand{\HyperName}{HyperDoc}
\newcommand{\Clef}{Clef}
\newcommand{\Lisp}{Common LISP}
\newcommand{\naglib}{NAG Foundation Library}
\newcommand{\GoBackToWork}
{\vspace{2}\newline
{Click on \ \UpButton{} \ to go back to what you were doing.}}
```

—————

Special hooks to Unix

All unix commands should be done as macros defined here so we don't have to go hunting when moving between Unix versions.

— util.ht —

```
\newcommand{\newspadclient}[1]
{xterm -n "#1" -e \SPAD/bin/clef \SPAD/bin/server/spadclient}
\newcommand{\searchwindow}[2]{\unixwindow{#1}{\SPAD/lib/htsearch "#2"}}
\newcommand{\unixwindow}[2]{\unixlink{#1}{#2}}
\newcommand{\menuunixlink}[2]{\item\unixlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menuunixcommand}[2]{\item\unixcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\menuunixwindow}[2]{\item\unixwindow{\menuitemstyle{#1}}{#2}}
```

HyperDoc menu macros

— util.ht —

```
% Example:
%
% \beginmenu
% \menulink{Thing One}{PageOne} la da di da da ...
% \menulink{Thin Two}{PageTwo} do da day ...
% \item \ACmdMacro{\menuitemstyle{Thing Three}} la di da ...
% \endmenu

% The menu environment

\newcommand{\beginmenu}          {\beginitems[\MenuDotBitmap]}
\newcommand{\endmenu}           {\enditems}

% This is the usual format for a menu item.

\newcommand{\menuitemstyle}[1]  {\{\MenuDotBitmap\}#1}

% Often-used menu item forms

%   These two simply do links
\newcommand{\menudownlink}[2]    {\item\downlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulink}[2]        {\menudownlink{#1}{#2}}

%   This will cause lower level links to have a HOME button
\newcommand{\menumemolink}[2]    {\item\memolink{\menuitemstyle{#1}}{#2}}

%   This opens a new window for the linked page.
\newcommand{\menuwindowlink}[2]  {\item>windowlink{\menuitemstyle{#1}}{#2}}

%   These execute lisp commands in various flavors
\newcommand{\menulispcommand}[2]
```

```

{\item\lispcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispdownlink}[2]
{\item\lispdownlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispmemolink}[2]
{\item\lispmemolink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispwindowlink}[2]
{\item\lispwindowlink{\menuitemstyle{#1}}{#2}}

% This executes a unix command
\newcommand{\menuunixcmd}[2]{\item\unixcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\searchresultentry}[3]
{\tab{3}\item#3\tab{8}\downlink{\menuitemstyle{#1}}{#2}\newline}
\newcommand{\newsearchresultentry}[3]
{\tab{3}\item#1\tab{8}\downlink{\menuitemstyle{#2}}{#3}\newline}

```

Bitmaps and bitmap manipulation macros

— util.ht —

```

\newcommand{\htbmdir}{\env{AXIOM}/doc/bitmaps}
\newcommand{\htbmfile}[1]{\htbmdir /#1.bitmap}
\newcommand{\htbitmap}[1]{\inputbitmap{\htbmfile{#1}}}
\newcommand{\ControlBitmap}[1]{\controlbitmap{\htbmfile{#1}}}

% next group of bitmaps frequently appear in the titlebar
\newcommand{\ContinueBitmap}{\ControlBitmap{continue}}
\newcommand{\DoItBitmap}{\ControlBitmap{doit}}
\newcommand{\ExitBitmap}{\ControlBitmap{exit3d}}
\newcommand{\HelpBitmap}{\ControlBitmap{help3d}}
\newcommand{\ReturnBitmap}{\ControlBitmap{home3d}}
\newcommand{\NoopBitmap}{\ControlBitmap{noop3d}}
\newcommand{\UpBitmap}{\ControlBitmap{up3d}}

\newcommand{\MenuDotBitmap}{\htbitmap{menudot}}

% Including control panel pixmaps for help pages:

\newcommand{\helpbit}[1]
{\centerline{\inputpixmap{\env{AXIOM}/doc/pixmaps/{#1}}}}

```

HyperDoc button objects

— util.ht —

```
\newcommand{\ContinueButton}[1]{\downlink{Click here}{#1} to continue.}
\newcommand{\ExitButton}[1]{\memolink{\ExitBitmap}{#1}}
\newcommand{\HelpButton}[1]{\memolink{\HelpBitmap}{#1}}
\newcommand{\StdHelpButton}{\HelpButton{ugHyperPage}}
\newcommand{\StdExitButton}{\ExitButton{ProtectedQuitPage}}
\newcommand{\UpButton}{\upbutton{\UpBitmap}{UpPage}}
\newcommand{\ReturnButton}{\returnbutton{\ReturnBitmap}{ReturnPage}}
\newcommand{\on}[1]{\inputbox[1]{#1}{\htbmfile{pick}}
  {\htbmfile{unpick}}}}
\newcommand{\off}[1]{\inputbox[0]{#1}{\htbmfile{pick}}
  {\htbmfile{unpick}}}}
```

Standard HyperDoc button configurations

— util.ht —

```
\newcommand{\autobutt}[1]{\helppage{#1}}
\newcommand{\autobuttons}{}
\newcommand{\exitbuttons}{}

\newcommand{\autobuttLayout}[1]{\centerline{#1}}
\newcommand{\autobuttMaker}[1]{\autobuttLayout{\HelpButton{#1}}}
\newcommand{\riddlebuttons}[1]{\autobuttLayout{\link{\HelpBitmap}{#1}}}

% Macro for downward compatibility (?).

\newcommand{\simplebox}[2]
{\inputbox[#1]{#2}{\htbitmap{xbox}}{\htbitmap{xopenbox}}}
```

HyperDoc graphics macros

— util.ht —

```
% Including viewport bitmaps within \HyperName pages:
```

```

\newcommand{\viewport}[1]{\inputimage{{#1}.view/image}}
\newcommand{\axiomViewport}[1]
{\inputimage{\env{AXIOM}/doc/viewports/{#1}.view/image}}
\newcommand{\spadviewport}[1]{\axiomViewport{#1}}

% Creating a real live viewport:

\newcommand{\viewportbutton}[2]{\unixcommand{#1}{viewalone #2}}
\newcommand{\axiomViewportbutton}[2]
{\unixcommand{#1}{viewalone \$AXIOM/doc/viewports/{#2}}}
\newcommand{\spadviewportbutton}[2]{\axiomViewportbutton{#1}{#2}}

% Making active viewport buttons:

\newcommand{\viewportasbutton}[1]
{\unixcommand{\inputimage{{#1}.view/image}}{viewalone {#1}}}
\newcommand{\axiomViewportasbutton}[1]
{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/{#1}.view/image}}
{viewalone \$AXIOM/doc/viewports/{#1}}}
\newcommand{\spadviewportasbutton}[1]{\axiomViewportasbutton{#1}}

```

TeX and LaTeX compatibility macros

— util.ht —

```

AssociationList

⇒ “Table” (TableXmpPage) [3.106](#) on page [1298](#)
 ⇒ “List” (ListXmpPage) [3.64](#) on page [866](#)
 — **alist.ht** —

```
\begin{page}{AssociationListXmpPage}{AssociationList}
\beginscroll
```

The `\spadtype{AssociationList}` constructor provides a general structure for associative storage. This type provides association lists in which data objects can be saved according to keys of any type. For a given association list, specific types must be chosen for the keys and entries. You can think of the representation of an association list as a list of records with key and entry fields.

Association lists are a form of table and so most of the operations available for \spadtype{Table} are also available for \spadtype{AssociationList}. They can also be viewed as lists and can be manipulated accordingly.

```
\xrc{
This is a \pspadtype{Record} type with age and gender fields.
}{
\spadpaste{Data := Record(monthsOld : Integer, gender : String) \bound{Data}}
}
\xrc{
In this expression, \spad{al} is declared to be an association
list whose keys are strings and whose entries are the above records.
}{
\spadpaste{al : AssociationList(String,Data) \free{Data}\bound{al}}
}
\xrc{
The \spadfunFrom{table}{AssociationList} operation is used to create
an empty association list.
}{
\spadpaste{al := table() \free{al}\bound{al1}}
}
\xrc{
You can use assignment syntax to add things to the association list.
}{
\spadpaste{al."bob" := [407,"male"]\Data \free{al1}\bound{al2}}
}
\xrc{
}{
\spadpaste{al."judith" := [366,"female"]\Data \free{al2}\bound{al3}}
}
\xrc{
}{
\spadpaste{al."katie" := [24,"female"]\Data \free{al3}\bound{al4}}
}
\xrc{
Perhaps we should have included a species field.
}{
\spadpaste{al."smokie" := [200,"female"]\Data \free{al4}\bound{al5}}
}
\xrc{
Now look at what is in the association list.
Note that the last-added (key, entry) pair is at the beginning of the list.
}{
\spadpaste{al \free{al5}}
}
\xrc{
You can reset the entry for an existing key.
}{
\spadpaste{al."katie" := [23,"female"]\Data \free{al5}\bound{al6}}
```

```

}
\xtc{
Use \spadfunFromX{delete}{AssociationList} to destructively remove
an element of the association list.
Use \spadfunFrom{delete}{AssociationList} to return a copy of the
association list with the element deleted.
The second argument is the index of the element to delete.
}{
\spadpaste{delete!(a1,1) \free{a16}\bound{a17}}
}

— array1.ht —

```

\begin{page}{OneDimensionalArrayXmpPage}{OneDimensionalArray}
\beginscroll
The \spadtype{OneDimensionalArray} domain is used for storing data in
a one-dimensional indexed data structure. Such an array is a
homogeneous data structure in that all the entries of the array must
belong to the same Axiom domain. Each array has a fixed length
specified by the user and arrays are not extensible. The indexing of
one-dimensional arrays is one-based. This means that the “first”
element of an array is given the index \spad{1}.
See also \downlink{‘Vector’}{VectorXmpPage}\ignore{Vector} and
\downlink{‘FlexibleArray’}{FlexibleArrayXmpPage}\ignore{FlexibleArray}.
\xtc{
To create a one-dimensional array, apply the
operation \spadfun{oneDimensionalArray} to a list.
}{
\spadpaste{oneDimensionalArray [i**2 for i in 1..10]}
}
\xtc{
Another approach is to first create \spad{a}, a one-dimensional
array of 10 \spad{0}'s.
\spadtype{OneDimensionalArray} has the convenient
abbreviation \spadtype{ARRAY1}.
}{
\spadpaste{a : ARRAY1 INT := new(10,0)\bound{a}}
}
\xtc{
Set each \spad{i}th element to i, then display the result.
}{

```

```

\spadpaste{for i in 1..10 repeat a.i := i; a\bound{a1}\free{a}}
}
\xtc{
Square each element by mapping the function
\texht{\$i \mapsto i^2\$}{i +-> i**2} onto each element.
}{
\spadpaste{map!(i +-> i ** 2,a); a\bound{a3}\free{a2}}
}
\xtc{
Reverse the elements in place.
}{
\spadpaste{reverse! a\bound{a4}\free{a3}}
}
\xtc{
Swap the \spad{4}th and \spad{5}th element.
}{
\spadpaste{swap!(a,4,5); a\bound{a5}\free{a4}}
}
\xtc{
Sort the elements in place.
}{
\spadpaste{sort! a \bound{a6}\free{a5}}
}
\xtc{
Create a new one-dimensional array \spad{b} containing the
last 5 elements of \spad{a}.
}{
\spadpaste{b := a(6..10)\bound{b}\free{a6}}
}
\xtc{
Replace the first 5 elements of \spad{a} with those of \spad{b}.
}{
\spadpaste{copyInto!(a,b,1)\free{b}}
}

3.5 array2.ht

TwoDimensionalArray

- ⇒ “The Any Domain” ([ugTypesAnyNonePage](#)) [7](#) on page [1668](#)
 - ⇒ “Matrix” ([MatrixXmpPage](#)) [3.75](#) on page [984](#)
 - ⇒ “OneDimensionalArray” ([OneDimensionalArrayXmpPage](#)) [3.4](#) on page [138](#)
- array2.ht —

```
\begin{page}{TwoDimensionalArrayXmpPage}{TwoDimensionalArray}
\beginscroll
```

The `\spadtype{TwoDimensionalArray}` domain is used for storing data in a `\twodim{}` data structure indexed by row and by column. Such an array is a homogeneous data structure in that all the entries of the array must belong to the same Axiom domain (although see [\downlink{“The Any Domain”}{ugTypesAnyNonePage}](#) in Section 2.6 [\ignore{ugTypesAnyNone}](#)). Each array has a fixed number of rows and columns specified by the user and arrays are not extensible. In Axiom, the indexing of two-dimensional arrays is one-based. This means that both the “first” row of an array and the “first” column of an array are given the index `\spad{1}`. Thus, the entry in the upper left corner of an array is in position `\spad{(1,1)}`.

The operation `\spadfunFrom{new}{TwoDimensionalArray}` creates an array with a specified number of rows and columns and fills the components of that array with a specified entry. The arguments of this operation specify the number of rows, the number of columns, and the entry.

```
\xtc{
This creates a five-by-four array of integers, all of whose entries are
zero.
}{
\spadpaste{arr : ARRAY2 INT := new(5,4,0) \bound{arr}}
}
```

The entries of this array can be set to other integers using the operation `\spadfunFrom{setelt}{TwoDimensionalArray}`.

```
\xtc{
```

```

Issue this to set the element in the upper left corner of this array to
\spad{17}.
}{
\spadpaste{setelt(arr,1,1,17) \free{arr}\bound{arr1}}
}
\xtc{
Now the first element of the array is \spad{17.}
}{
\spadpaste{arr \free{arr1}}
}
\xtc{
Likewise, elements of an array are extracted using the operation
\spadfunFrom{elt}{TwoDimensionalArray}.
}{
\spadpaste{elt(arr,1,1) \free{arr1}}
}
\xtc{
Another way to use these two operations is as follows.
This sets the element in position \spad{(3,2)} of the array to \spad{15}.
}{
\spadpaste{arr(3,2) := 15 \free{arr1}\bound{arr2}}
}
\xtc{
This extracts the element in position \spad{(3,2)} of the array.
}{
\spadpaste{arr(3,2) \free{arr2}}
}
The operations \spadfunFrom{elt}{TwoDimensionalArray} and
\spadfunFrom{setelt}{TwoDimensionalArray} come equipped with an error
check which verifies that the indices are in the proper ranges.
For example, the above array has five rows and four columns, so if you ask
for the entry in position \spad{(6,2)} with \spad{arr(6,2)} Axiom
displays an error message.
If there is no need for an error check, you can call the operations
\spadfunFrom{qelt}{TwoDimensionalArray} and
\spadfunFromX{qsetelt}{TwoDimensionalArray} which provide the same
functionality but without the error check.
Typically, these operations are called in well-tested programs.

\xtc{
The operations \spadfunFrom{row}{TwoDimensionalArray} and
\spadfunFrom{column}{TwoDimensionalArray} extract rows and columns,
respectively, and return objects of \spadtype{OneDimensionalArray} with
the same underlying element type.
}{
\spadpaste{row(arr,1) \free{arr2}}
}
\xtc{
}{
\spadpaste{column(arr,1) \free{arr2}}
}

```

```

}

\xtc{
You can determine the dimensions of an array by calling the
operations \spadfunFrom{nrows}{TwoDimensionalArray} and
\spadfunFrom{ncols}{TwoDimensionalArray},
which return the number of rows and columns, respectively.
}{
\spadpaste{nrows(arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{ncols(arr) \free{arr2}}
}
\xtc{
To apply an operation to every element of an array, use
\spadfunFrom{map}{TwoDimensionalArray}.
This creates a new array.
This expression negates every element.
}{
\spadpaste{map(-,arr) \free{arr2}}
}
\xtc{
This creates an array where all the elements are doubled.
}{
\spadpaste{map((x +-> x + x),arr) \free{arr2}}
}
\xtc{
To change the array destructively, use
\spadfunFromX{map}{TwoDimensionalArray} instead of
\spadfunFrom{map}{TwoDimensionalArray}.
If you need to make a copy of any array, use
\spadfunFrom{copy}{TwoDimensionalArray}.
}{
\spadpaste{arrc := copy(arr) \bound{arrc}\free{arr2}}
}
\xtc{
}{
\spadpaste{map!(-,arrc) \free{arrc}}
}
\xtc{
}{
\spadpaste{arrc \free{arrc}}
}
\xtc{
}{
\spadpaste{arr \free{arr2}}
}

\xtc{

```

Use `\spadfunFrom{member?}{TwoDimensionalArray}` to see if a given element is in an array.

```

}{
\spadpaste{member?(17,arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{member?(10317,arr) \free{arr2}}
}
\xtc{
To see how many times an element appears in an array, use
\spadfunFrom{count}{TwoDimensionalArray}.
}{
\spadpaste{count(17,arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{count(0,arr) \free{arr2}}
}

```

For more information about the operations available for `\spadtype{TwoDimensionalArray}`, issue `\spadcmd{}show TwoDimensionalArray`.

3.7 bbtree.ht

BalancedBinaryTree

— bbtree.ht —

```
\begin{page}{BalancedBinaryTreeXmpPage}{BalancedBinaryTree}
\beginscroll
\spadtype{BalancedBinaryTrees(S)} is the domain
of balanced binary trees with elements of type \spad{S} at the nodes.
A binary tree is either \spadfun{empty} or else
consists of a \spadfun{node} having a \spadfun{value}
and two branches, each branch a binary tree.
A balanced binary tree is one that is balanced with respect its leaves.
One with \texht{$2^k$}{2*k} leaves is
perfectly “balanced”: the tree has minimum depth, and
the \spadfun{left} and \spadfun{right}
branch of every interior node is identical in shape.
```

Balanced binary trees are useful in algebraic computation for so-called “divide-and-conquer” algorithms. Conceptually, the data for a problem is initially placed at the root of the tree. The original data is then split into two subproblems, one for each subtree. And so on. Eventually, the problem is solved at the leaves

of the tree. A solution to the original problem is obtained by some mechanism that can reassemble the pieces. In fact, an implementation of the Chinese Remainder Algorithm using balanced binary trees was first proposed by David Y. Y. Yun at the IBM T. J. Watson Research Center in Yorktown Heights, New York, in 1978. It served as the prototype for polymorphic algorithms in Axiom.

In what follows, rather than perform a series of computations with a single expression, the expression is reduced modulo a number of integer primes, a computation is done with modular arithmetic for each prime, and the Chinese Remainder Algorithm is used to obtain the answer to the original problem.

We illustrate this principle with the computation of
 $12^2 = 144$ $\{12 ** 2 = 144\}$.

```
\xctc{
A list of moduli.
}{
\spadpaste{lm := [3,5,7,11]\bound{lm}}
}
\xctc{
The expression \spad{modTree(n, lm)}
creates a balanced binary tree with leaf values
\spad{n mod m} for each modulus \spad{m} in \spad{lm}.
}{
\spadpaste{modTree(12,lm)\free{lm}}
}
\xctc{
Operation \spad{modTree} does this using
operations on balanced binary trees.
We trace its steps.
Create a balanced binary tree \spad{t} of zeros with four leaves.
}{
\spadpaste{t := balancedBinaryTree(\#lm, 0)\bound{t}\free{lm}}
}
\xctc{
The leaves of the tree are set to the individual moduli.
}{
\spadpaste{setleaves!(t,lm)\bound{t1}\free{t}}
}
\xctc{
Use \spadfunX{mapUp} to do
a bottom-up traversal of \spad{t}, setting each interior node
to the product of the values at the nodes of its children.
}{
\spadpaste{mapUp!(t,*)\bound{t2}\free{t1}}
}
\xctc{
The value at the node of every subtree is the product of the moduli
of the leaves of the subtree.
```

```

}{
\spadpaste{t \bound{t3}\free{t2}}
}
\xtc{
Operation \spadfunX{mapDown}\spad{(t,a,fn)} replaces the value
\spad{v} at each node of \spad{t} by \spad{fn(a,v)}.
}{
\spadpaste{mapDown!(t,12,_rem)\bound{t4}\free{t3}}
}
\xtc{
The operation \spadfun{leaves} returns the leaves of the resulting
tree.
In this case, it returns the list of \spad{12 mod m} for each
modulus \spad{m}.
}{
\spadpaste{leaves \% \bound{t5}\free{t4}}
}
\xtc{
Compute the square of the images of \spad{12} modulo each \spad{m}.
}{
\spadpaste{squares := [x**2 rem m for x in \% for m in lm]\bound{t6}\free{t5}}
}
\xtc{
Call the Chinese Remainder Algorithm to get the
answer for \texht{$12^2$}{12**2}.
}{
\spadpaste{chineseRemainder(\%,lm)\free{t6}}
}
\endscroll
\autobuttons

\begin{page}{BinaryExpansionXmpPage}{BinaryExpansion}
\beginscroll
All rational numbers have repeating binary expansions.
Operations to access the individual bits of a binary expansion can
be obtained by converting the value to \spadtype{RadixExpansion(2)}.
More examples of expansions are available in
\downlink{‘DecimalExpansion’}{DecimalExpansionXmpPage}
\ignore{DecimalExpansion},
\downlink{‘HexadecimalExpansion’}{HexExpansionXmpPage}
\ignore{HexadecimalExpansion}, and
\downlink{‘RadixExpansion’}{RadixExpansionXmpPage}\ignore{RadixExpansion}.

\xtc{
The expansion (of type \spadtype{BinaryExpansion}) of a rational number
is returned by the \spadfunFrom{binary}{BinaryExpansion} operation.

3.10 bop.ht

BasicOperator

— bop.ht —

```

\begin{page}{BasicOperatorXmpPage}{BasicOperator}
\beginscroll

```

A basic operator is an object that can be symbolically applied to a list of arguments from a set, the result being a kernel over that set or an expression.

In addition to this section, please see

\downlink{‘Expression’}{ExpressionXmpPage}\ignore{Expression}
and \downlink{‘Kernel’}{KernelXmpPage}\ignore{Kernel}
for additional information and examples.

You create an object of type \axiomType{BasicOperator} by using the \axiomFunFrom{operator}{BasicOperator} operation.

This first form of this operation has one argument and it must be a symbol.

The symbol should be quoted in case the name has been used as an identifier to which a value

has been assigned.

A frequent application of `\axiomType{BasicOperator}` is the creation of an operator to represent the unknown function when solving a differential equation.

```
\xctc{
Let \axiom{y} be the unknown function in terms of \axiom{x}.
}{
\spadpaste{y := operator 'y \bound{y}}
}
%
\xctc{
This is how you enter
the equation \axiom{y}'' + y' + y = 0.
}{
\spadpaste{deq := D(y x, x, 2) + D(y x, x) + y x = 0\bound{e1}\free{y}}
}
%
\xctc{
To solve the above equation, enter this.
}{
\spadpaste{solve(deq, y, x) \free{e1}\free{y}}
}
See \downlink{''Solution of Differential Equations''}{ugProblemDEQPage}
in Section 8.10\ignore{ugProblemDEQ}
for this kind of use of \axiomType{BasicOperator}.
```

Use the single argument form of `\axiomFunFrom{operator}{BasicOperator}` (as above) when you intend to use the operator to create functional expressions with an arbitrary number of arguments

```
\xctc{
{\it Nary} means an arbitrary number of arguments can be used
in the functional expressions.
}{
\spadpaste{nary? y \free{y}}
}
%
\xctc{
}{
\spadpaste{unary? y \free{y}}
}
}
```

Use the two-argument form when you want to restrict the number of arguments in the functional expressions created with the operator.

```
\xctc{
This operator can only be used to create functional expressions
with one argument.
}{
\spadpaste{opOne := operator('opOne, 1) \bound{opOne}}
}
\xctc{
}
```

```

}{
\spadpaste{nary? opOne \free{opOne}}
}
\xtc{
}{
\spadpaste{unary? opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{arity}{BasicOperator} to learn the number of
arguments that can be used.
It returns {\tt "false"} if the operator is nary.
}{
\spadpaste{arity opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{name}{BasicOperator} to learn the name of an
operator.
}{
\spadpaste{name opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{is?}{BasicOperator} to learn if an operator has a
particular name.
}{
\spadpaste{is?(opOne, 'z2) \free{opOne}}
}
\xtc{
You can also use a string as the name to be tested against.
}{
\spadpaste{is?(opOne, "opOne") \free{opOne}}
}

```

You can attached named properties to an operator.
These are rarely used at the top-level of the Axiom
interactive environment but are used with Axiom
library source code.

```

\xtc{
By default, an operator has no properties.
}{
\spadpaste{properties y \free{y}}
}
The interface for setting and getting properties is somewhat awkward
because the property values are stored as values of type
\axiomType{None}.
\xtc{
Attach a property by using \axiomFunFrom{setProperty}{BasicOperator}.
}{
\spadpaste{setProperty(y, "use", "unknown function" :: None )
\free{y}\bound{spy}}
}

```

```

\xtc{
}{
\spadpaste{properties y \free{y spy}}
}
\xtc{
We {\it know} the property value has type \axiomType{String}.
}{
\spadpaste{property(y, "use") :: None pretend String \free{y spy}}
}
\xtc{
Use \axiomFunFrom{deleteProperty!}{BasicOperator} to destructively
remove a property.
}{
\spadpaste{deleteProperty!(y, "use") \free{y spy}\bound{dpy}}
}
\xtc{
}{
\spadpaste{properties y \free{dpy}}
}
\endscroll
\autobuttons
\end{page}

BinarySearchTree

— bstree.ht —

```

\begin{page}{BinarySearchTreeXmpPage}{BinarySearchTree}
\beginscroll

\spadtype{BinarySearchTree(R)} is the domain of binary trees with
elements of type \spad{R}, ordered across the nodes of the tree. A
non-empty binary search tree has a value of type \spad{R}, and
\spadfun{right} and \spadfun{left} binary search subtrees. If a
subtree is empty, it is displayed as a period ('.').

\xtc{
Define a list of values to be placed across the tree.
The resulting tree has \spad{8} at the root;
all other elements are in the left subtree.

```

```

}{
\spadpaste{lv := [8,3,5,4,6,2,1,5,7]\bound{lv}}
}
\xtc{
A convenient way to create a binary search tree is to
apply the operation \spadfun{binarySearchTree} to a list of elements.
}{
\spadpaste{t := binarySearchTree lv\free{lv}\bound{t}}
}
\xtc{
Another approach is to first create an empty binary search tree of integers.
}{
\spadpaste{emptybst := empty()\$BSTREE(INT)\bound{e}}
}
\xtc{
Insert the value \spad{8}.
This establishes \spad{8} as the root of the binary search tree.
Values inserted later that are less than \spad{8} get stored in
the \spadfun{left} subtree, others in the \spadfun{right} subtree.
}{
\spadpaste{t1 := insert!(8,emptybst)\free{e}\bound{t1}}
}
\xtc{
Insert the value \spad{3}. This number becomes the root of the
\spadfun{left} subtree of \spad{t1}.
For optimal retrieval, it is thus important to insert the
middle elements first.
}{
\spadpaste{insert!(3,t1)\free{t1}}
}
\xtc{
We go back to the original tree \spad{t}.
The leaves of the binary search tree are those which have empty
\spadfun{left} and \spadfun{right} subtrees.
}{
\spadpaste{leaves t\free{t}}
}
\xtc{
The operation
\spadfun{split}\spad{(k,t)} returns a \spadgloss{record} containing
the two subtrees: one with all elements ‘less’ than \spad{k},
another with elements ‘greater’ than \spad{k}.
}{
\spadpaste{split(3,t)\free{t}}
}
\xtc{
Define \userfun{insertRoot} to insert new elements by
creating a new node.
}{
\spadpaste{insertRoot: (INT,BSTREE INT) -> BSTREE INT\bound{x}}
}

```

```

}
\xtc{
The new node puts the inserted value between its
“less” tree and “greater” tree.
}{
\begin{spadsrc}[\bound{x1}\free{x}]
insertRoot(x, t) ==
  a := split(x, t)
  node(a.less, x, a.greater)
\end{spadsrc}
}
\xtc{
Function \userfun{buildFromRoot} builds
a binary search tree from a list of elements \spad{ls}
and the empty tree \spad{emptybst}.
}{
\spadpaste{buildFromRoot ls == reduce(insertRoot,ls,emptybst)
\bound{x2}\free{x1 e}}
}
\xtc{
Apply this to the reverse of the list \spad{lv}.
}{
\spadpaste{rt := buildFromRoot reverse lv\bound{rt}\free{lv x2}}
}
\xtc{
Have Axiom check that these are equal.
}{
\spadpaste{(t = rt)@Boolean\free{rt t}}
}
\endscroll

3.12 card.ht

CardinalNumber

← “Axiom Number Types” (NumberPage) [3.80](#) on page [1021](#)

— card.ht —

```
\begin{page}{CardinalNumberXmpPage}{CardinalNumber}
\begin{scroll}
The \spadtype{CardinalNumber} domain can be used for values indicating
the cardinality of sets, both finite and infinite.
For example, the \spadfunFrom{dimension}{VectorSpace} operation in the
category \spadtype{VectorSpace} returns a cardinal number.

The non-negative integers have a natural construction as cardinals
\begin{verbatim}
0 = #{ }, 1 = {0}, 2 = {0, 1}, ..., n = {i | 0 <= i < n}.
\end{verbatim}
The fact that \spad{0} acts as a zero for the multiplication of
cardinals is equivalent to the axiom of choice.

\xtc{
Cardinal numbers can be created by conversion from non-negative integers.
}{
\spadpaste{c0 := 0 :: CardinalNumber \bound{c0}}
}
\xtc{
```

```

}{
\spadpaste{c1 := 1 :: CardinalNumber \bound{c1}}
}
\xtc{
}{
\spadpaste{c2 := 2 :: CardinalNumber \bound{c2}}
}
\xtc{
}{
\spadpaste{c3 := 3 :: CardinalNumber \bound{c3}}
}
\xtc{
They can also be obtained as the named cardinal \spad{Aleph(n)}.
}{
\spadpaste{A0 := Aleph 0 \bound{A0}}
}
\xtc{
}{
\spadpaste{A1 := Aleph 1 \bound{A1}}
}
\xtc{
The \spadfunFrom{finite?}{CardinalNumber} operation tests whether a
value is a finite cardinal, that is, a non-negative integer.
}{
\spadpaste{finite? c2 \free{c2}}
}
\xtc{
}{
\spadpaste{finite? A0 \free{A0}}
}
\xtc{
Similarly, the \spadfunFrom{countable?}{CardinalNumber}
operation determines whether a value is
a countable cardinal, that is, finite or \spad{Aleph(0)}.
}{
\spadpaste{countable? c2 \free{c2}}
}
\xtc{
}{
\spadpaste{countable? A0 \free{A0}}
}
\xtc{
}{
\spadpaste{countable? A1 \free{A1}}
}
Arithmetic operations are defined on cardinal numbers as follows:
If \spad{x = \#X} and \spad{y = \#Y} then

\indent{0}
\spad{x+y = \#(X+Y)}

```

```

\tab{20} cardinality of the disjoint union \newline
\spad{x-y = \#(X-Y)}
\tab{20} cardinality of the relative complement \newline
\spad{x*y = \#(X*Y)}
\tab{20} cardinality of the Cartesian product \newline
\spad{x**y = \#(X**Y)}
\tab{20} cardinality of the set of maps from \spad{Y} to \spad{X} \newline

\xtc{
Here are some arithmetic examples.
}{

CartesianTensor

— carten.ht —

```

\begin{page}{CartesianTensorXmpPage}{CartesianTensor}
\begin{scroll}

\spadtype{CartesianTensor(i0,dim,R)}
provides Cartesian tensors with
components belonging to a commutative ring \spad{R}.
Tensors can be described as a generalization of vectors and matrices.
This gives a concise {\it tensor algebra} for multilinear objects
supported by the \spadtype{CartesianTensor} domain.
You can form the inner or outer product of any two tensors and you can add
or subtract tensors with the same number of components.
Additionally, various forms of traces and transpositions are useful.

The \spadtype{CartesianTensor} constructor allows you to specify the
minimum index for subscripting.
In what follows we discuss in detail how to manipulate tensors.

\xtc{
Here we construct the domain of Cartesian tensors of dimension 2 over the
integers, with indices starting at 1.
}{
\spadpaste{CT := CARTEN(i0 := 1, 2, Integer) \bound{CT i0}}
}

\subsubsection{Forming tensors}
\labelSpace{2pc}
\xtc{
Scalars can be converted to tensors of rank zero.
}{
\spadpaste{t0: CT := 8 \free{CT}\bound{t0}}
}

```

```

}
\xtc{
}{
\spadpaste{rank t0 \free{t0}}
}
\xtc{
Vectors (mathematical direct products, rather than one dimensional array
structures) can be converted to tensors of rank one.
}{
\spadpaste{v: DirectProduct(2, Integer) := directProduct [3,4] \bound{v}}
}
\xtc{
}{
\spadpaste{Tv: CT := v \free{v CT}\bound{Tv}}
}
\xtc{
Matrices can be converted to tensors of rank two.
}{
\spadpaste{m: SquareMatrix(2, Integer) := matrix [[1,2],[4,5]] \bound{m}}
}
\xtc{
}{
\spadpaste{Tm: CT := m \bound{Tm}\free{CT m}}
}
\xtc{
}{
\spadpaste{n: SquareMatrix(2, Integer) := matrix [[2,3],[0,1]] \bound{n}}
}
\xtc{
}{
\spadpaste{Tn: CT := n \bound{Tn}\free{CT n}}
}
\xtc{
In general, a tensor of rank \spad{k} can be formed by making a
list of rank \spad{k-1} tensors or, alternatively, a \spad{k}-deep nested
list of lists.
}{
\spadpaste{t1: CT := [2, 3] \free{CT}\bound{t1}}
}
\xtc{
}{
\spadpaste{rank t1 \free{t1}}
}
\xtc{
}{
\spadpaste{t2: CT := [t1, t1] \free{CT t1}\bound{t2}}
}
\xtc{
}{
\spadpaste{t3: CT := [t2, t2] \free{CT t2}\bound{t3}}
}

```

```

}
\xtc{
}{
\spadpaste{tt: CT := [t3, t3]; tt := [tt, tt] \free{CT t3}\bound{tt}}
}
\xtc{
}{
\spadpaste{rank tt \free{tt}}
}

\subsubsection{Multiplication}
%\head{subsection}{Multiplication}{ugxCartenMult}

Given two tensors of rank \spad{k1} and \spad{k2}, the outer
{CartesianTensor}
\spadfunFrom{product}{CartesianTensor} forms a new tensor of rank
\spad{k1+k2}.
\xtc{
Here
\texht{\$T_{mn}(i,j,k,l) = T_m(i,j) \ T_n(k,l).\$}{%
\spad{Tmn(i,j,k,l) = Tm(i,j)*Tn(k,l).}}
}{
\spadpaste{Tmn := product(Tm, Tn)\free{Tm Tn}\bound{Tmn}}
}

The inner product (\spadfunFrom{contract}{CartesianTensor}) forms a tensor
{CartesianTensor}
of rank \spad{k1+k2-2}.
This product generalizes the vector dot product and matrix-vector product
by summing component products along two indices.
\xtc{
Here we sum along the second index of \texht{\$T_m\$}{\spad{Tm}} and the
first index of \texht{\$T_v\$}{\spad{Tv}}.
Here
\texht{\$T_{mv} = \sum_{j=1}^{\hbox{\tiny\rm dim}} T_m(i,j) \ T_v(j)\$}{%
\spad{Tmv(i) = sum Tm(i,j) * Tv(j) for j in 1..dim.}}
}{
\spadpaste{Tmv := contract(Tm,2,Tv,1)\free{Tm Tv}\bound{Tmv}}
}

The multiplication operator \spadopFrom{*}{CartesianTensor} is scalar
multiplication or an inner product depending on the ranks of the
arguments.
\xtc{
If either argument is rank zero it is treated as scalar multiplication.
Otherwise, \spad{a*b} is the inner product summing the last index of
\spad{a} with the first index of \spad{b}.
}{
\spadpaste{Tm*Tv \free{Tm Tv}}
}

```

```

\xtc{
This definition is consistent with the inner product on matrices
and vectors.
}{
\spadpaste{Tmv = m * v \free{Tmv m v}}
}

\subsubsection{Selecting Components}
%\head{subsection}{Selecting Components}{ugxCartenSelect}

\labelSpace{2pc}
\xtc{
For tensors of low rank (that is, four or less), components can be selected
by applying the tensor to its indices.
}{
\spadpaste{t0()      \free{t0}}
}
\xtc{
}{
\spadpaste{t1(1+1)   \free{t1}}
}
\xtc{
}{
\spadpaste{t2(2,1)   \free{t2}}
}
\xtc{
}{
\spadpaste{t3(2,1,2) \free{t3}}
}
\xtc{
}{
\spadpaste{Tmn(2,1,2,1) \free{Tmn}}
}
\xtc{
A general indexing mechanism is provided for a list of indices.
}{
\spadpaste{t0[]      \free{t0}}
}
\xtc{

\spadpaste{t1[2]     \free{t1}}
}
\xtc{
}{
\spadpaste{t2[2,1]   \free{t2}}
}
\xtc{
The general mechanism works for tensors of arbitrary rank, but is
somewhat less efficient since the intermediate index list must be created.
}{

```

```

\spadpaste{t3[2,1,2] \free{t3}}
}
\xtc{
}{
\spadpaste{Tmn[2,1,2,1] \free{Tmn}}
}

\subsubsection{Contraction}
%\head{subsection}{Contraction}{ugxCartenContract}

A “contraction” between two tensors is an inner product, as we have
seen above.
You can also contract a pair of indices of a single tensor.
This corresponds to a “trace” in linear algebra.
The expression \spad{contract(t,k1,k2)} forms a new tensor by summing the
diagonal given by indices in position \spad{k1} and \spad{k2}.
\xtc{
This is the tensor given by
\texht{\$xT_{mn} = \sum_{k=1}^{\hbox{\tiny\rm dim}} T_{mn}(k,k,i,j).\$}{%
\spad{cTmn(i,j) = sum Tmn(k,k,i,j) for k in 1..dim.}}
}{
\spadpaste{cTmn := contract(Tmn,1,2) \free{Tmn}\bound{cTmn}}
}
\xtc{
Since \spad{Tmn} is the outer product of matrix \spad{m} and matrix \spad{n},
the above is equivalent to this.
}{
\spadpaste{trace(m) * n \free{m n}}
}
\xtc{
In this and the next few examples,
we show all possible contractions of \spad{Tmn} and their matrix
algebra equivalents.
}{
\spadpaste{contract(Tmn,1,2) = trace(m) * n \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,1,3) = transpose(m) * n \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,1,4) = transpose(m) * transpose(n) \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,2,3) = m * n \free{Tmn m n}}
}
\xtc{
}{

```

```
\spadpaste{contract(Tmn,2,4) = m * transpose(n) \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,3,4) = trace(n) * m \free{Tmn m n}}
}
```

```
\subsubsection{Transpositions}
%\head{subsection}{Transpositions}{ugxCartenTranspos}
```

You can exchange any desired pair of indices using the
`\spadfunFrom{transpose}{CartesianTensor}` operation.

```
\labelSpace{1pc}
\xtc{
Here the indices in positions one and three are exchanged, that is,
\texht{\$T_{mn}(i,j,k,l) = T_{mn}(k,j,i,l).\$}{%
\spad{tTmn(i,j,k,l) = Tmn(k,j,i,l).}}
}{
\spadpaste{tTmn := transpose(Tmn,1,3) \free{tTmn}}
}
\xtc{
If no indices are specified, the first and last index are exchanged.
}{
\spadpaste{transpose Tmn \free{Tmn}}
}
\xtc{
This is consistent with the matrix transpose.
}{
\spadpaste{transpose Tm = transpose m \free{Tm m}}
}
```

If a more complicated reordering of the indices is required, then the
`\spadfunFrom{reindex}{CartesianTensor}` operation can be used.
This operation allows the indices to be arbitrarily permuted.

```
\xtc{
This defines
\texht{\$rT_{mn}(i,j,k,l) = \allowbreak T_{mn}(i,l,j,k).\$}{%
\spad{rTmn(i,j,k,l) = Tmn(i,l,j,k).}}
}{
\spadpaste{rTmn := reindex(Tmn, [1,4,2,3]) \free{Tmn}\bound{rTmn}}
}
```

```
\subsubsection{Arithmetic}
%\head{subsection}{Arithmetic}{ugxCartenArith}
```

```
\labelSpace{2pc}
\xtc{
Tensors of equal rank can be added or subtracted so arithmetic
expressions can be used to produce new tensors.
```

```

}{
\spadpaste{tt := transpose(Tm)*Tn - Tn*transpose(Tm) \free{Tm Tn}\bound{tt2}}
}
\xtc{
}{
\spadpaste{Tv*(tt+Tn) \free{tt2 Tv Tn}}
}
\xtc{
}{
\spadpaste{reindex(product(Tn,Tn),[4,3,2,1])+3*Tn*product(Tm,Tm) \free{Tm Tn}}
}

\subsubsection{Specific Tensors}
%\head{subsection}{Specific Tensors}{ugxCartenSpecific}

Two specific tensors have properties which depend only on the
dimension.

\labelSpace{1pc}
\xtc{
The Kronecker delta satisfies
\texht{}{%
\begin{verbatim}
      +-
      |  1  if i  = j
delta(i,j) = |
      |  0  if i  ^= j
      +-
\end{verbatim}
}%
}
}{
\spadpaste{delta: CT := kroneckerDelta() \free{CT}\bound{delta}}
}
\xtc{
This can be used to reindex via contraction.
}{
\spadpaste{contract(Tmn, 2, delta, 1) = reindex(Tmn, [1,3,4,2])
\free{Tmn delta}}
}

\xtc{
The Levi Civita symbol determines the sign of a permutation of indices.
}{
\spadpaste{epsilon:CT := leviCivitaSymbol() \free{CT}\bound{epsilon}}
}
Here we have:
\texht{}{%
\begin{verbatim}
epsilon(i1,...,idim)
    = +1  if i1,...,idim is an even permutation of i0,...,i0+dim-1

```

```

      = -1 if i1,...,idim is an odd permutation of i0,...,i0+dim-1
      = 0 if i1,...,idim is not a permutation of i0,...,i0+dim-1
\end{verbatim}
}
\xtc{
This property can be used to form determinants.
}{
\spadpaste{contract(epsilon*Tm*epsilon, 1,2) = 2 * determinant m \free{epsilon Tm m}}
}

\subsubsection{Properties of the CartesianTensor domain}
%\head{subsection}{Properties of the CartesianTensor domain}{ugxCartenProp}

\spadtype{GradedModule(R,E)} denotes ‘‘\spad{E}-graded \spad{R}-module’’,
that is, a collection of \spad{R}-modules indexed by an abelian monoid
\spad{E}.
An element \spad{g} of \spad{G[s]} for some specific \spad{s}
in \spad{E} is said to be an element of \spad{G} with
\spadfunFrom{degree}{GradedModule} \spad{s}.
Sums are defined in each module \spad{G[s]} so two elements of
\spad{G} can be added if they have the same degree.
Morphisms can be defined and composed by degree to give the
mathematical category of graded modules.

\spadtype{GradedAlgebra(R,E)} denotes ‘‘\spad{E}-graded \spad{R}-algebra.’’
{CartesianTensor}
A graded algebra is a graded module together with a degree preserving
\spad{R}-bilinear map, called the \spadfunFrom{product}{GradedAlgebra}.

\begin{verbatim}
degree(product(a,b))= degree(a) + degree(b)

product(r*a,b) = product(a,r*b) = r*product(a,b)
product(a1+a2,b) = product(a1,b) + product(a2,b)
product(a,b1+b2) = product(a,b1) + product(a,b2)
product(a,product(b,c)) = product(product(a,b),c)
\end{verbatim}

The domain \spadtype{CartesianTensor(i0, dim, R)} belongs
to the category \spadtype{GradedAlgebra(R, NonNegativeInteger)}.
The non-negative integer \spadfunFrom{degree}{GradedAlgebra}
is the tensor rank
and the graded algebra \spadfunFrom{product}{GradedAlgebra}
is the tensor outer product.
The graded module addition captures the notion that
only tensors of equal rank can be added.

If \spad{V} is a vector space of dimension \spad{dim} over \spad{R},
then the tensor module \spad{T[k](V)} is defined as
\begin{verbatim}

```

```

T[0](V) = R
T[k](V) = T[k-1](V) * V
\end{verbatim}
where \spadop{*} denotes the \spad{R}-module tensor
\spadfunFrom{product}{GradedAlgebra}.
\spadtype{CartesianTensor(i0,dim,R)} is the graded algebra in which
the degree \spad{k} module is \spad{T[k](V)}.

```

```

\subsubsection{Tensor Calculus}
%\head{subsection}{Tensor Calculus}{ugxCartenCalculus}

```

It should be noted here that often tensors are used in the context of tensor-valued manifold maps. This leads to the notion of covariant and contravariant bases with tensor component functions transforming in specific ways under a change of coordinates on the manifold. This is no more directly supported by the \spadtype{CartesianTensor} domain than it is by the \spadtype{Vector} domain. However, it is possible to have the components implicitly represent component maps by choosing a polynomial or expression type for the components. In this case, it is up to the user to satisfy any constraints which arise on the basis of this interpretation.

CharacterClass

— cclass.ht —

```
\begin{page}{CharacterClassXmpPage}{CharacterClass}
\beginscroll
```

The `\spadtype{CharacterClass}` domain allows classes of characters to be defined and manipulated efficiently.

```
\xtc{
Character classes can be created by giving either a string or a list
of characters.
}{
\spadpaste{c11 :=
charClass [char "a", char "e", char "i", char "o", char "u", char "y"]
\bound{c11}}
}
\xtc{
}{
\spadpaste{c12 := charClass "bcdfghjklmnpqrstvwxyz" \bound{c12}}
}
\xtc{
A number of character classes are predefined for convenience.
}{
\spadpaste{digit()}
}
\xtc{
}{
\spadpaste{hexDigit()}
}
\xtc{
}{
\spadpaste{upperCase()}
}
\xtc{
}{
\spadpaste{lowerCase()}
}
\xtc{
}{
\spadpaste{alphabetic()}
}
\xtc{
}{
\spadpaste{alphanumeric()}}
```

```

}
\xtc{
You can quickly test whether a character belongs to a class.
}{

\begin{page}{CliffordAlgebraXmpPage}{CliffordAlgebra}
\beginscroll

\noindent
\spadtype{CliffordAlgebra(n,K,Q)} defines a vector space of dimension
\texht{2^n}\spad{2*n} over the field \texht{K}\spad{K} with a
given quadratic form \spad{Q}.
If \texht{e_1, \ldots, e_n}\spad{\{e(i), 1<=i<=n\}}
is a basis for \texht{K^n}\spad{K*n} then
\begin{verbatim}

```

```

{ 1,
  e(i) 1 <= i <= n,
  e(i1)*e(i2) 1 <= i1 < i2 <=n,
  ...,
  e(1)*e(2)*...*e(n) }
\end{verbatim}
is a basis for the Clifford algebra.
The algebra is defined by the relations
\begin{verbatim}
e(i)*e(i) = Q(e(i))
e(i)*e(j) = -e(j)*e(i),  i ^= j
\end{verbatim}
Examples of Clifford Algebras are
gaussians (complex numbers), quaternions,
exterior algebras and spin algebras.

The Exterior Algebra on a Three Space

— clif.ht —

```

\begin{page}{ugxCliffordExteriorPage}{The Exterior Algebra on a Three Space}
\beginscroll

\labelSpace{4pc}
\xtc{
This is the field over which we will work, rational functions with
integer coefficients.
}{
\spadpaste{K := Fraction Polynomial Integer \bound{K}}
}
\xtc{

```

If we chose the three by three zero quadratic form, we obtain the exterior algebra on $\text{\spad}\{e(1), e(2), e(3)\}$.

```

}{
\spadpaste{Ext := CliffordAlgebra(3, K, quadraticForm 0) \bound{Ext}
\free{K}}
}
\xtc{
This is a three dimensional vector algebra.
We define \spad{i}, \spad{j}, \spad{k} as the unit vectors.
}{
\spadpaste{i: Ext := e(1) \free{Ext}\bound{i}}
}
\xtc{
}{
\spadpaste{j: Ext := e(2) \free{Ext}\bound{j}}
}
\xtc{
}{
\spadpaste{k: Ext := e(3) \free{Ext}\bound{k}}
}
\xtc{
Now it is possible to do arithmetic.
}{
\spadpaste{x := x1*i + x2*j + x3*k \free{i j k}\bound{x}}
}
\xtc{
}{
\spadpaste{y := y1*i + y2*j + y3*k \free{i j k}\bound{y}}
}
\xtc{
}{
\spadpaste{x + y          \free{x y}}
}
\xtc{
}{
\spadpaste{x * y + y * x \free{x y}}
}
\xtc{
On an \spad{n} space, a grade \spad{p} form has a dual \spad{n-p} form.
In particular, in three space the dual of a grade two element identifies
\spad{e1*e2->e3, e2*e3->e1, e3*e1->e2}.
}{
\spadpaste{dual2 a == coefficient(a,[2,3]) * i + coefficient(a,[3,1]) *
j + coefficient(a,[1,2]) * k \free{i j k}\bound{dual2}}
}
\xtc{
The vector cross product is then given by this.
}{
\spadpaste{dual2(x*y) \free{x y dual2}}
}

\begin{page}{ComplexXmpPage}{Complex}
\beginscroll
The \spadtype{Complex} constructor implements complex objects over a
commutative ring \spad{R}.
Typically, the ring \spad{R} is \spadtype{Integer}, \spadtype{Fraction
Integer}, \spadtype{Float} or \spadtype{DoubleFloat}.
\spad{R} can also be a symbolic type, like \spadtype{Polynomial Integer}.
For more information about the numerical and graphical aspects of complex
numbers,
see \downlink{``Numeric Functions''}{ugProblemNumericPage} in Section 8.1
\ignore{ugProblemNumeric}.

\xtc{
Complex objects are created by the \spadfunFrom{complex}{Complex} operation.
}{
\spadpaste{a := complex(4/3,5/2) \bound{a}}

```

```

}
\xtc{
}{
\spadpaste{b := complex(4/3,-5/2) \bound{b}}
}
\xtc{
The standard arithmetic operations are available.
}{
\spadpaste{a + b \free{a b}}
}
\xtc{
}{
\spadpaste{a - b \free{a b}}
}
\xtc{
}{
\spadpaste{a * b \free{a b}}
}
\xtc{
If \spad{R} is a field, you can also divide the complex objects.
}{
\spadpaste{a / b \free{a b}\bound{adb}}
}
\xtc{
Use a conversion (\downlink{''Conversion''}{ugTypesConvertPage}
in Section 2.7\ignore{ugTypesConvert}) to view the last
object as a fraction of complex integers.
}{
\spadpaste{\% :: Fraction Complex Integer \free{adb}}
}
\xtc{
The predefined macro \spad{\%i} is defined to be \spad{complex(0,1)}.
}{
\spadpaste{3.4 + 6.7 * \%i}

Type: Factored Complex Integer

ContinuedFraction

Continued fractions have been a fascinating and useful tool in mathematics for well over three hundred years. Axiom implements

continued fractions for fractions of any Euclidean domain. In practice, this usually means rational numbers. In this section we demonstrate some of the operations available for manipulating both finite and infinite continued fractions. It may be helpful if you review `\downlink{'Stream'}{StreamXmpPage}\ignore{Stream}` to remind yourself of some of the operations with streams.

The `\spadtype{ContinuedFraction}` domain is a field and therefore you can add, subtract, multiply and divide the fractions.

`\xtc{`
The `\spadfunFrom{continuedFraction}{ContinuedFraction}` operation converts its fractional argument to a continued fraction.

```
{
\spadpaste{c := continuedFraction(314159/100000) \bound{c}}
}
%
```

This display is a compact form of the bulkier

```
\texht{\narrowDisplay{%
3 + {\displaystyle 1 \over {\displaystyle
7 + {1 \over {\displaystyle
15 + {1 \over {\displaystyle
1 + {1 \over {\displaystyle
25 + {1 \over {\displaystyle
1 + {1 \over {\displaystyle
7 + {1 \over 4}}}}}}}}}}}}}}}%
}{
\begin{verbatim}
```

$$\begin{array}{r}
 3 + \cfrac{1}{\cfrac{7 + \cfrac{1}{\cfrac{15 + \cfrac{1}{\cfrac{1 + \cfrac{1}{\cfrac{25 + \cfrac{1}{\cfrac{1 + \cfrac{1}{\cfrac{7 + \cfrac{1}{4}}}}}}}}}}}}}}}}{
 \end{array}$$

```
\end{verbatim}
```

```
}
```

You can write any rational number in a similar form. The fraction will be finite and you can always take the ‘‘numerators’’ to be `\spad{1}`. That is, any rational number can be written as a simple, finite continued fraction of the form

```
\texht{\narrowDisplay{%
a_1 + {\displaystyle 1 \over {\displaystyle
```

```

a_2 + {1 \over {\displaystyle
a_3 + {1 \over {\displaystyle \ddots
a_{n-1} + {1 \over a_n}}}}}}}%
}{
\begin{verbatim}
      a(1) +          1
          -----
      a(2) +          1
          -----
      a(3) +
          .
          .
          .
          1
          -----
      a(n-1) + 1
          ----
              a(n)

\end{verbatim}
}
\xtc{
The \texht{$a_i$}{\spad{a(i)}} are called partial quotients and the
operation \spadfunFrom{partialQuotients}{ContinuedFraction} creates a
stream of them.
}{
\spadpaste{partialQuotients c \free{c}}
}
\xtc{
By considering more and more of the fraction, you get the
\spadfunFrom{convergents}{ContinuedFraction}.
For example, the first convergent is \texht{$a_1$}{\spad{a(1)}},
the second is
\texht{$a_1 + 1/a_2$}{\spad{a(1) + 1/a(2)}} and so on.
}{
\spadpaste{convergents c \free{c}}
}
%
\xtc{
Since this is a finite continued fraction, the last convergent is
the original rational number, in reduced form.
The result of \spadfunFrom{approximants}{ContinuedFraction}
is always an infinite stream, though it may just repeat the ‘‘last’’
value.
}{
\spadpaste{approximants c \free{c}}
}
\xtc{
Inverting \spad{c} only changes the partial quotients of its fraction
by inserting a \spad{0} at the beginning of the list.
}{

```

```

\spadpaste{pq := partialQuotients(1/c) \free{c}\bound{pq}}
}
\xtc{
Do this to recover the original continued fraction from this list of
partial quotients.
The three-argument form of the
\spadfunFrom{continuedFraction}{ContinuedFraction} operation takes an
element which is the whole part of the fraction, a stream of elements
which are the numerators of the fraction, and a stream of elements which
are the denominators of the fraction.
}{
\spadpaste{continuedFraction(first pq,repeating [1],rest pq) \free{pq}}
}
\xtc{
The streams need not be finite for
\spadfunFrom{continuedFraction}{ContinuedFraction}.
Can you guess which irrational number has the following continued
fraction?
See the end of this section for the answer.
}{
\spadpaste{z:=continuedFraction(3,repeating [1],repeating [3,6]) \bound{z}}
}
%

```

In 1737 Euler discovered the infinite continued fraction expansion

```

\texht{\narrowDisplay%
{{e - 1} \over 2} =
{1 \over {\displaystyle
1 + {1 \over {\displaystyle
6 + {1 \over {\displaystyle
10 + {1 \over {\displaystyle
14 + \cdots}}}}}}}}}%
}{
\begin{verbatim}
      e - 1          1
      ---- = -----
      2      1 +      1
                -----
                6 +      1
                      -----
                      10 +      1
                            -----
                            14 + ...
\end{verbatim}
}

```

We use this expansion to compute rational and floating point approximations of `\spad{e}`.^{Footnote{For this and other interesting expansions, see C. D. Olds, {\it Continued Fractions}, New Mathematical Library, (New York: Random House, 1963), pp. 134--139.}}

```

\xtc{
By looking at the above expansion, we see that the whole part is
\spad{0} and the numerators are all equal to \spad{1}. This
constructs the stream of denominators.
}{
\spadpaste{dens:Stream Integer := cons(1,generate((x+-->x+4),6))
\bound{dens}}
}
\xtc{
Therefore this is the continued fraction expansion for
\texht{$(e - 1) / 2$}{\spad{(e-1)/2}}.
}{
\spadpaste{cf := continuedFraction(0,repeating [1],dens)
\free{dens}\bound{cf}}
}
\xtc{
These are the rational number convergents.
}{
\spadpaste{ccf := convergents cf \free{cf}\bound{ccf}}
}
\xtc{
You can get rational convergents for \spad{e} by multiplying by \spad{2} and
adding \spad{1}.
}{
\spadpaste{eConvergents := [2*e + 1 for e in ccf] \bound{ec}\free{ccf}}
}
%
\xtc{
You can also compute the floating point approximations to these convergents.
}{
\spadpaste{eConvergents :: Stream Float \free{ec}}
}
\xtc{
Compare this to the value of \spad{e} computed by the
\spadfunFrom{exp}{Float} operation in \spadtype{Float}.
}{
\spadpaste{exp 1.0}
}

```

In about 1658, Lord Brouncker established the following expansion
for $\frac{4}{\pi}$.

```

\texht{\narrowDisplay{
1 + {\displaystyle
1 \over {\displaystyle
2 + {9 \over {\displaystyle
2 + {25 \over {\displaystyle
2 + {49 \over {\displaystyle
2 + {81 \over {\displaystyle
2 + \cdots}}}}}}}}}}}%

```

```

}{
\begin{verbatim}
      1 +          1
      -----
      2 +          9
      -----
      2 +         25
      -----
      2 +         49
      -----
      2 +         81
      -----
      2 + ...

\end{verbatim}
}
\xtc{
Let's use this expansion to compute rational and floating point
approximations for \texht{$\pi$}\spad{pi}}.
}{
\spadpaste{
cf := continuedFraction(1,[(2*i+1)**2 for i in 0..],repeating [2])
\bound{cf1}}
}
\xtc{
}{
\spadpaste{ccf := convergents cf \free{cf1}\bound{ccf1}}
}
\xtc{
}{
\spadpaste{
piConvergents := [4/p for p in ccf] \bound{piConvergents}\free{ccf1}}
}
\xtc{
As you can see, the values are converging to
\texht{$\pi$}\spad{pi} = 3.14159265358979323846...,
but not very quickly.
}{
\spadpaste{piConvergents :: Stream Float \free{piConvergents}}
}

\xtc{
You need not restrict yourself to continued fractions of integers.
Here is an expansion for a quotient of Gaussian integers.
}{
\spadpaste{continuedFraction((- 122 + 597*%i)/(4 - 4*%i))}
}
\xtc{
This is an expansion for a quotient of polynomials in one variable
with rational number coefficients.
}{

```

```

\spadpaste{r : Fraction UnivariatePolynomial(x,Fraction Integer)
\bound{rdec}}
}
\xtc{
}{
\spadpaste{r := ((x - 1) * (x - 2)) / ((x-3) * (x-4)) \free{rdec}
\bound{r}}
}
\xtc{
}{
\spadpaste{continuedFraction r \free{r}}
}

```

To conclude this section, we give you evidence that

```
\texht{\narrowDisplay{%
```

```
z =
```

```
{3+\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+
\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+...}}%
```

```
{
```

```
\begin{verbatim}
```

$$\begin{array}{r}
 z = 3 + \cfrac{1}{\cfrac{3 + \cfrac{1}{\cfrac{6 + \cfrac{1}{\cfrac{3 + \cfrac{1}{\cfrac{6 + \cfrac{1}{3 + \dots}}}}}}}}}}
 \end{array}$$

```
\end{verbatim}
```

```
}
```

is the expansion of $\sqrt{11}$ the square root of $\spad{11}$.

3.19 cycles.ht

CycleIndicators

— cycles.ht —

```

\begin{page}{CycleIndicatorsXmpPage}{CycleIndicators}
\beginscroll
This section is based upon the paper
J. H. Redfield, ‘‘The Theory of Group-Reduced Distributions’’,
and is an application of group theory to enumeration problems.
It is a development of the work by P. A. MacMahon on the

The theory is based upon the power sum symmetric functions
\subscriptIt{s}{i}
which are the sum of the \eth{\it i} powers of the variables.
The cycle index of a permutation is an expression that specifies
the sizes of the cycles of a permutation, and
may be represented as a partition.
A partition of a non-negative integer \spad{n} is a collection
of positive integers called its parts whose sum is \spad{n}.
For example, the partition
\texht{$(3^2 \ 2 \ 1^2)$}{\spad{3**2 2 1**2}}}
will be used to represent
\texht{${s^2_3 s_2 s^2_1}$}{\spad{(s_3)**2 s_2 (s_1)**2}}
and will indicate that the permutation has two cycles of length 3,
one of length 2 and two of length 1.
The cycle index of a permutation group is the sum of the cycle indices
of its permutations divided by the number of permutations.
The cycle indices of certain groups are provided.
\xtc{
We first expose something from the library.
}{
\spadpaste{expose EVALCYC}
}
\xtc{
The operation \spadfun{complete} returns the cycle index of the
symmetric group of order \spad{n} for argument \spad{n}.
Alternatively, it is the \eth{\spad{n}} complete homogeneous symmetric
function expressed in terms of power sum symmetric functions.
}{
\spadpaste{complete 1}
}
\xtc{
}{
\spadpaste{complete 2}
}
\xtc{
}{
\spadpaste{complete 3}
}
\xtc{
}{
\spadpaste{complete 7}
}
\xtc{

```

The operation `\spadfun{elementary}` computes the `\eth{\spad{n}}` elementary symmetric function for argument `\spad{n.}`

```
{
\spadpaste{elementary 7}
}
```

```
\xtc{
```

The operation `\spadfun{alternating}` returns the cycle index of the alternating group having an even number of even parts in each cycle partition.

```
{
\spadpaste{alternating 7}
}
```

```
\xtc{
```

The operation `\spadfun{cyclic}` returns the cycle index of the cyclic group.

```
{
\spadpaste{cyclic 7}
}
```

```
\xtc{
```

The operation `\spadfun{dihedral}` is the cycle index of the dihedral group.

```
{
\spadpaste{dihedral 7}
}
```

```
\xtc{
```

The operation `\spadfun{graphs}` for argument `\spad{n}` returns the cycle index of the group of permutations on the edges of the complete graph with `\spad{n}` nodes induced by applying the symmetric group to the nodes.

```
{
\spadpaste{graphs 5}
}
```

The cycle index of a direct product of two groups is the product of the cycle indices of the groups.

Redfield provided two operations on two cycle indices which will be called ‘‘cup’’ and ‘‘cap’’ here.

The `\spadfun{cup}` of two cycle indices is a kind of scalar product that combines monomials for permutations with the same cycles.

The `\spadfun{cap}` operation provides the sum of the coefficients of the result of the `\spadfun{cup}` operation which will be an integer that enumerates what Redfield called group-reduced distributions.

We can, for example, represent `\spad{complete 2 * complete 2}` as the set of objects `\spad{a a b b}` and `\spad{complete 2 * complete 1 * complete 1}` as `\spad{c c d e.}`

```
\xtc{
```

This integer
is the number of different sets of four pairs.

```

}{
\spadpaste{cap(complete 2**2, complete 2*complete 1**2)}
}
For example,
\begin{verbatim}
a a b b      a a b b      a a b b      a a b b
c c d e      c d c e      c e c d      d e c c
\end{verbatim}

\xtc{
This integer
is the number of different sets of four pairs no two pairs being equal.
}{
\spadpaste{cap(elementary 2**2, complete 2*complete 1**2)}
}
For example,
\begin{verbatim}
a a b b      a a b b
c d c e      c e c d
\end{verbatim}
In this case the configurations enumerated are easily constructed,
however the theory merely enumerates them providing little help in
actually constructing them.
\xtc{
Here are the
number of 6-pairs, first from \spad{a a a b b c,} second from
\spad{d d e e f g.}
}{
\spadpaste{cap(complete 3*complete 2*complete 1,
complete 2**2*complete 1**2)}
}
\xtc{
Here it is again, but with no equal pairs.
}{
\spadpaste{cap(elementary 3*elementary 2*elementary 1,
complete 2**2*complete 1**2)}
}
\xtc{
}{
\spadpaste{cap(complete 3*complete 2*complete 1,
elementary 2**2*elementary 1**2)}
}
\xtc{
The number of 6-triples, first from \spad{a a a b b c,} second from
\spad{d d e e f g,} third from \spad{h h i i j j.}
}{
\spadpaste{eval(cup(complete 3*complete 2*complete 1,
cup(complete 2**2*complete 1**2,complete 2**3)))}
}
\xtc{

```

```

The cycle index of vertices of a square is dihedral 4.
}{
\spadpaste{square:=dihedral 4}
}
\xtc{
The number of different squares with 2 red vertices and 2 blue vertices.
}{
\spadpaste{cap(complete 2**2,square)}
}
\xtc{
The number of necklaces with 3 red beads, 2 blue beads and 2 green beads.
}{
\spadpaste{cap(complete 3*complete 2**2,dihedral 7)}
}
\xtc{
The number of graphs with 5 nodes and 7 edges.
}{
\spadpaste{cap(graphs 5,complete 7*complete 3)}
}
\xtc{
The cycle index of rotations of vertices of a cube.
}{
\spadpaste{s(x) == powerSum(x)}
}
\xtc{
}{
\spadpaste{cube:=(1/24)*(s 1**8+9*s 2**4 + 8*s 3**2*s 1**2+6*s 4**2)}
}
\xtc{
The number of cubes with 4 red vertices and 4 blue vertices.
}{
\spadpaste{cap(complete 4**2,cube)}
}
\xtc{
The number of labeled graphs with degree sequence \spad{2 2 2 1 1}
with no loops or multiple edges.
}{
\spadpaste{
cap(complete 2**3*complete 1**2,wreath(elementary 4,elementary 2))}
}
\xtc{
Again, but
with loops allowed but not multiple edges.
}{
\spadpaste{
cap(complete 2**3*complete 1**2,wreath(elementary 4,complete 2))}
}
\xtc{
Again, but
with multiple edges allowed, but not loops

```

```

}{
\spadpaste{cap(complete 2**3*complete 1**2,wreath(complete 4,elementary 2))}
}
\xtc{
Again, but
with both multiple edges and loops allowed
}{
\spadpaste{cap(complete 2**3*complete 1**2,wreath(complete 4,complete 2))}
}

```

Having constructed a cycle index for a configuration
we are at liberty to evaluate the

```
\subscriptIt{s}{i}
```

components any way we please.

For example we can produce enumerating generating functions.

```
{CycleIndicators}
```

This is done by providing a function `\spad{f}` on an integer `\spad{i}`
to the value required of `\subscriptIt{s}{i}`,
and then evaluating `\spad{eval(f, cycleindex)}`.

```

\xtc{

}
The operation \spadfun{SFunction} is the S-function or Schur function
of a partition written
as a descending list of integers expressed in terms of power sum
symmetric functions.
\xtc{
In this case the argument partition represents a tableau shape.
For example \spad{3,2,2,1} represents a tableau with three boxes in the
first row, two boxes in the second and third rows, and one box in the
fourth row.
\spad{SFunction [3,2,2,1]}
counts the number of different tableaux of shape \spad{3, 2, 2, 1} filled
with objects with an ascending order in the columns and a
non-descending order in the rows.
}{
\spadpaste{sf3221:= SFunction [3,2,2,1] \bound{sf3221}}
}
\xtc{
This is the number filled with \spad{a a b b c c d d.}
}{
\spadpaste{cap(sf3221,complete 2**4) \free{sf3221}}
}
The configurations enumerated above are:
\begin{verbatim}
a a b      a a c      a a d
b c        b b        b b
c d        c d        c c
d          d          d
\end{verbatim}
\xtc{
This is the number of tableaux filled with \spad{1..8.}
}{
\spadpaste{cap(sf3221, powerSum 1**8)\free{sf3221}}
}
\xtc{
The coefficient of \texht{$x^n$}\spad{x**n} is the number
of column strict reverse plane partitions of \spad{n} of shape
\spad{3 2 2 1.}
}{
\spadpaste{eval(Integers, sf3221)\free{i sf3221}}
}
The smallest is

3.22 derham.ht

DeRhamComplex

— derham.ht —

```

\begin{page}{DeRhamComplexXmpPage}{DeRhamComplex}
\begin{scroll}

The domain constructor \spadtype{DeRhamComplex} creates the
class of differential forms of arbitrary degree over a coefficient ring.
The De Rham complex constructor takes two arguments: a ring,
\spad{coefRing,} and a list of coordinate variables.

\xtc{
This is the ring of coefficients.
}{
\spadpaste{coefRing := Integer \bound{coefRing}}
}
\xtc{
These are the coordinate variables.

```

```

}{
\spadpaste{lv : List Symbol := [x,y,z] \bound{lv}}
}
\xtc{
This is the De Rham complex of Euclidean three-space using
coordinates \spad{x, y} and \spad{z.}
}{
\spadpaste{der := DERHAM(coefRing,lv) \free{coefRing}\free{lv}
\bound{der}}
}

This complex allows us to describe differential forms having
expressions of integers as coefficients.
These coefficients can involve any number of variables, for example,
\spad{f(x,t,r,y,u,z).}
As we've chosen to work with ordinary
Euclidean three-space, expressions involving these forms
are treated as functions of
\spad{x, y} and \spad{z} with the additional arguments
\spad{t, r} and \spad{u} regarded as symbolic constants.
\xtc{
Here are some examples of coefficients.
}{
\spadpaste{R := Expression coefRing \free{coefRing}\bound{R}}
}
\xtc{
}{
\spadpaste{f : R := x**2*y*z-5*x**3*y**2*z**5 \free{R}\bound{f}}
}
\xtc{
}{
\spadpaste{g : R := z**2*y*cos(z)-7*sin(x**3*y**2)*z**2 \free{R}\bound{g}}
}
\xtc{
}{
\spadpaste{h : R :=x*y*z-2*x**3*y*z**2 \free{R}\bound{h}}
}
\xtc{
We now define
the multiplicative basis elements for the exterior algebra over \spad{R}.
}{
\spadpaste{dx : der := generator(1) \free{der}\bound{dx}}
}
\xtc{
}{
\spadpaste{dy : der := generator(2)\free{der}\bound{dy}}
}
\xtc{
}{
\spadpaste{dz : der := generator(3)\free{der}\bound{dz}}
}

```

```

}
\xtc{
This is an alternative way to give the above assignments.
}{
\spadpaste{[dx,dy,dz] := [generator(i)\$der for i in 1..3] \free{der}
\bound{dxyz}}
}
\xtc{
Now we define some one-forms.
}{
\spadpaste{alpha : der := f*dx + g*dy + h*dz \bound{alpha}
\free{der f g h dxyz}}
}
\xtc{
}{
\spadpaste{beta : der := cos(tan(x*y*z)+x*y*z)*dx + x*dy
\bound{beta}\free{der f g h dxyz}}
}
\xtc{
A well-known theorem states that the composition of
\spadfunFrom{exteriorDifferential}{DeRhamComplex}
with itself is the zero map for continuous forms.
Let's verify this theorem for \spad{alpha}.
}{
\spadpaste{exteriorDifferential alpha; \free{alpha}\bound{ed}}
}
\xtc{
We suppressed the lengthy output of the last expression, but nevertheless, the
composition is zero.
}{
\spadpaste{exteriorDifferential \% \free{ed}}
}

\xtc{
Now we check that \spadfunFrom{exteriorDifferential}{DeRhamComplex}
is a "graded derivation" \spad{D,} that is, \spad{D} satisfies:
\begin{verbatim}
D(a*b) = D(a)*b + (-1)**degree(a)*a*D(b)
\end{verbatim}
}{
\spadpaste{gamma := alpha * beta \bound{gamma}\free{alpha}\free{beta}}
}
\xtc{
We try this for the one-forms \spad{alpha} and \spad{beta}.
}{
\spadpaste{exteriorDifferential(gamma) -
(exteriorDifferential(alpha)*beta - alpha * exteriorDifferential(beta))
\free{alpha beta gamma}}
}
\xtc{

```

```

Now we define some ‘‘basic operators’’ (see
\downlink{‘Operator’}{OperatorXmpPage}\ignore{Operator}).
}{
\spadpaste{a : BOP := operator('a) \bound{ao}}
}
\xtc{
}{
\spadpaste{b : BOP := operator('b) \bound{bo}}
}
\xtc{
}{
\spadpaste{c : BOP := operator('c) \bound{co}}
}
\xtc{
We also define
some indeterminate one- and two-forms using these operators.
}{
\spadpaste{sigma := a(x,y,z) * dx + b(x,y,z) * dy + c(x,y,z) * dz
\bound{sigma}\free{ao bo co dxyz}}
}
\xtc{
}{
\spadpaste{theta := a(x,y,z) * dx * dy + b(x,y,z) * dx *
dz + c(x,y,z) * dy * dz \bound{theta}\free{ao bo co dxyz}}
}

\xtc{
This allows us to get formal definitions for the ‘‘gradient’’ \ldots
}{
\spadpaste{totalDifferential(a(x,y,z))\$der \free{ao der}}
}
\xtc{
the ‘‘curl’’ \ldots
}{
\spadpaste{exteriorDifferential sigma \free{sigma}}
}
\xtc{
and the ‘‘divergence.’’
}{
\spadpaste{exteriorDifferential theta \free{theta}}
}

\xtc{
Note that the De Rham complex is an algebra with unity.
This element \spad{1} is the basis for elements for zero-forms, that is,
functions in our space.
}{
\spadpaste{one : der := 1 \bound{one}\free{der}}
}

```

```

\xtc{
To convert a function to a function lying in the De Rham complex,
multiply the function by ‘‘one.’’
}{
\spadpaste{g1 : der := a([x,t,y,u,v,z,e]) * one \free{der one ao}\bound{g1}}
}
\xtc{
A current limitation of Axiom forces you to write
functions with more than four arguments using square brackets in this way.
}{
\spadpaste{h1 : der := a([x,y,x,t,x,z,y,r,u,x]) * one
\free{der one ao}\bound{h1}}
}

\xtc{
Now note how the system keeps track of where your coordinate functions
are located in expressions.
}{

DoubleFloat

⇐ “Axiom Number Types” (NumberPage) [3.80](#) on page [1021](#)
 ⇒ “Graphics” (ugGraphPage) [11](#) on page [1967](#)
 ⇒ “Numeric Functions” (ugProblemNumericPage) [12](#) on page [2079](#)
 ⇒ “Float” (FloatXmpPage) [3.41](#) on page [487](#)
 — dfloat.ht —

```

\begin{page}{DoubleFloatXmpPage}{DoubleFloat}
\beginscroll
Axiom provides two kinds of floating point numbers.
The domain \spadtype{Float} (abbreviation \spadtype{FLOAT})
implements a model of arbitrary
precision floating point numbers.
The domain \spadtype{DoubleFloat} (abbreviation \spadtype{DFLOAT})
is intended to make available
hardware floating point arithmetic in Axiom.
The actual model of floating point \spadtype{DoubleFloat} that provides is
system-dependent.
For example, on the IBM system 370 Axiom uses IBM double
precision which has fourteen hexadecimal digits of precision or roughly
sixteen decimal digits.
Arbitrary precision floats allow the user to specify the
precision at which arithmetic operations are computed.
Although this is an attractive facility, it comes at a cost.

```

Arbitrary-precision floating-point arithmetic typically takes twenty to two hundred times more time than hardware floating point.

The usual arithmetic and elementary functions are available for `\spadtype{DoubleFloat}`.
 Use `\spadsys{}show DoubleFloat` to get a list of operations or the Hyperdoc `\Browse{}` facility to get more extensive documentation about `\spadtype{DoubleFloat}`.

```
\xctc{
By default, floating point numbers that you enter into Axiom
are of type \spadtype{Float}.
}{
\spadpaste{2.71828}
}
You must therefore tell Axiom that you want to use
\spadtype{DoubleFloat} values and operations.
The following are some conservative guidelines for getting
Axiom to use \spadtype{DoubleFloat}.
```

```
\xctc{
To get a value of type \spadtype{DoubleFloat}, use a target with
\spadSyntax{@}, \ldots
}{
\spadpaste{2.71828@DoubleFloat}
}
\xctc{
a conversion, \ldots
}{
\spadpaste{2.71828 :: DoubleFloat}
}
\xctc{
or an assignment to a declared variable.
It is more efficient if you use a target rather than an explicit or
implicit conversion.
}{
\spadpaste{eApprox : DoubleFloat := 2.71828 \bound{eApprox}}
}
```

```
\xctc{
You also need to declare functions that work with
\spadtype{DoubleFloat}.
}{
\spadpaste{avg : List DoubleFloat -> DoubleFloat \bound{avgDec}}
}
\xctc{
}{
\begin{spadsrc}[\bound{avg}]\free{avgDec}
avg l ==
  empty? l => 0 :: DoubleFloat
```

```

    reduce(_+,1) / #1
\end{spadsrc}
}
\xtc{
}{
\spadpaste{avg [] \free{avg}}
}
\xtc{
}{
\spadpaste{avg [3.4,9.7,-6.8] \free{avg}}
}
\xtc{
Use package-calling for operations from \spadtype{DoubleFloat} unless
the arguments themselves are already of type \spadtype{DoubleFloat}.
}{
\spadpaste{cos(3.1415926)\$DoubleFloat}
}
\xtc{
}{
\spadpaste{cos(3.1415926 :: DoubleFloat)}
}

```

By far, the most common usage of `\spadtype{DoubleFloat}` is for functions to be graphed.

For more information about Axiom's numerical and graphical facilities, see

`\downlink{'Graphics'}{ugGraphPage}` in Section 7.

`\ignore{ugGraph}`,

`\downlink{'Numeric Functions'}{ugProblemNumericPage}` in Section 8.1 `\ignore{ugProblemNumeric}`, and

\begin{page}{DistributedMultivariatePolyXmpPage}
{DistributedMultivariatePoly}
\beginscroll

\text{\hyphenation{
Homo-gen-eous-Dis-tributed-Multi-var-i-ate-Pol-y-nomial
}}{}

\spadtype{DistributedMultivariatePoly} and
\spadtype{HomogeneousDistributedMultivariatePoly}, abbreviated
\spadtype{DMP} and \spadtype{HDMP}, respectively, are very similar to
\spadtype{MultivariatePolynomial} except that they are represented and
displayed in a non-recursive manner.
\xtc{
}{
\spadpaste{(d1,d2,d3) : DMP([z,y,x],FRAC INT) \bound{d1dec d2dec d3dec}}
}
\xtc{
The constructor
\spadtype{DMP} orders its monomials lexicographically while
\spadtype{HDMP} orders them by total order refined by reverse
lexicographic order.
}{
\spadpaste{d1 := -4*z + 4*y**2*x + 16*x**2 + 1 \bound{d1}\free{d1dec}}
}
\xtc{
}{
\spadpaste{d2 := 2*z*y**2 + 4*x + 1 \bound{d2}\free{d2dec}}
}
\xtc{
}{
\spadpaste{d3 := 2*z*x**2 - 2*y**2 - x \bound{d3}\free{d3dec}}
}
```

```

\xtc{
These constructors are mostly used in \texht{Gr\{o}bner}{Groebner}
basis calculations.
}{
\spadpaste{groebner [d1,d2,d3] \free{d1 d2 d3}}
}
\xtc{
}{
\spadpaste{(n1,n2,n3) : HDMP([z,y,x],FRAC INT) \bound{ndec}}
}
\xtc{
}{
\spadpaste{(n1,n2,n3) := (d1,d2,d3) \free{ndec}\bound{n}\free{d1 d2 d3}}
}
\xtc{
Note that we get a different
\texht{Gr\{o}bner}{Groebner} basis
when we use the \spadtype{HDMP} polynomials, as expected.
}{
\spadpaste{groebner [n1,n2,n3] \free{n}}
}

```

\spadtype{GeneralDistributedMultivariatePoly} is somewhat more flexible in the sense that as well as accepting a list of variables to specify the variable ordering, it also takes a predicate on exponent vectors to specify the term ordering. With this polynomial type the user can experiment with the effect of using completely arbitrary term orderings. This flexibility is mostly important for algorithms such as \texht{Gr\{o}bner}{Groebner} basis calculations which can be very sensitive to term ordering.

3.25 eq.ht

Equation

— eq.ht —

```

\begin{page}{EquationXmpPage}{Equation}
\beginscroll

```

The `\spadtype{Equation}` domain provides equations as mathematical objects. These are used, for example, as the input to various `\spadfunFrom{solve}{TransSolvePackage}` operations.

```

\xtc{
Equations are created using the equals symbol, \spadopFrom{=}{Equation}.
}{
\spadpaste{eq1 := 3*x + 4*y = 5 \bound{eq1}}
}
\xtc{
}{
\spadpaste{eq2 := 2*x + 2*y = 3 \bound{eq2}}
}
\xtc{
The left- and right-hand sides of an equation are accessible using
the operations \spadfunFrom{lhs}{Equation} and \spadfunFrom{rhs}{Equation}.
}{
\spadpaste{lhs eq1 \free{eq1}}
}
\xtc{
}{
\spadpaste{rhs eq1 \free{eq1}}
}

```

```

\xtc{
Arithmetic operations are supported
and operate on both sides of the equation.
}{
\spadpaste{eq1 + eq2 \free{eq1 eq2}}
}
\xtc{
}{
\spadpaste{eq1 * eq2 \free{eq1 eq2}}
}
\xtc{
}{
\spadpaste{2*eq2 - eq1 \free{eq1 eq2}}
}
\xtc{
Equations may be created for any type so the arithmetic operations
will be defined only when they make sense. For example,
exponentiation is not defined for equations involving non-square matrices.
}{
\spadpaste{eq1**2 \free{eq1}}
}

\xtc{
Note that an equals symbol is also used to {\it test}
for equality of values in certain contexts.
For example, \spad{x+1} and \spad{y} are unequal as polynomials.
}{
\spadpaste{if x+1 = y then "equal" else "unequal"}
}
\xtc{
}{
\spadpaste{eqpol := x+1 = y \bound{eqpol}}
}
\xtc{
If an equation is used where a \spadtype{Boolean} value
is required, then it is evaluated using the equality
test from the operand type.
}{
\spadpaste{if eqpol then "equal" else "unequal" \free{eqpol}}
}
\xtc{
If one wants a \spadtype{Boolean} value rather than an equation,
all one has to do is ask!
}{
\spadpaste{eqpol::Boolean \free{eqpol}}
}

3.26 eqtbl.ht

EqTable

⇒ “notitle” (TableXmpPage) [3.106](#) on page [1298](#)

— eqtbl.ht —

```
\begin{page}{EqTableXmpPage}{EqTable}
\beginscroll
```

The `\spadtype{EqTable}` domain provides tables where the keys are compared using `\spadfunFrom{eq?}{EqTable}`.

Keys are considered equal only if they are the same instance of a structure.

This is useful if the keys are themselves updatable structures.

Otherwise, all operations are the same as for type `\spadtype{Table}`.

See `\downlink{‘Table’}{TableXmpPage}\ignore{Table}`

for general information about tables.

```
\showBlurb{EqTable}
```

```
\xtc{
```

The operation `\spadfunFrom{table}{EqTable}` is here used to create a table where the keys are lists of integers.

```
}{
```

```
\spadpaste{e: EqTable(List Integer, Integer) := table() \bound{e}}
```

```
}
```

```
\xtc{
```

These two lists are equal according to `\spadopFrom{=}{List}`,

but not according to `\spadfunFrom{eq?}{List}`.

```
}{
```

```
\spadpaste{l1 := [1,2,3] \bound{l1}}
```

```
}
```

```
\xtc{
```

```
}{
```

```
\spadpaste{l2 := [1,2,3] \bound{l2}}
```

```
}
```

```
\xtc{
```

Because the two lists are not `\spadfunFrom{eq?}{List}`, separate values can be stored under each.

```
}{
```

```
\spadpaste{e.l1 := 111 \free{e l1} \bound{e1}}
```

```
}
```

```
\xtc{
```

```
}{
```

```
\spadpaste{e.l2 := 222 \free{e1 l2} \bound{e2}}
```

```
}
```

```
\xtc{
```

```
}{
```

```

Example of Standard Evaluation

— evalex.ht —

```
\begin{page}{PrefixEval}{Example of Standard Evaluation}
\beginscroll
We illustrate the general evaluation of {\em op a} for some
prefix operator {\em op} and operand {\em a}
by the example: {\em cos(2)}.
The evaluation steps are as follows:
\vspace{1}\newline
1.\tab{3}{\em a} evaluates to a value of some type.
\newline\tab{3}{\em Example:} {\em 2} evaluates to {\em 2} of type
\spadtype{Integer}
\newline
2.\tab{3}Axiom then chooses a function {\em op} based on the
type of {\em a}.
\newline\tab{3}{\em Example:} The function {\em cos:} \spadtype{Float} {\em ->}
\spadtype{Float} is chosen.
\newline
3.\tab{3}If the argument type of the function is different from that
of {\em a},
then the system coerces
%\downlink{coerces}{Coercion}
the value of {\em a} to the
argument type.
\newline\tab{3}{\em Example:} The integer {\em 2} is coerced to the
float {\em 2.0}.
\newline
4.\tab{3}The function is then applied to the value of {\em a} to
produce the value
for {\em op a}.
\newline\tab{3}{\em Example:} The function {\em cos} is applied to {\em 2.0}.
\vspace{1}\newline
Try it:
\example{cos(2)}

Example of Standard Evaluation

— evalex.ht —

```

\begin{page}{InfixEval}{Example of Standard Evaluation}
\beginscroll
We illustrate the general evaluation of {\em a op b} for some
infix operator {\em op} with operands {\em a} and {\em b}
by the example: {\em 2 + 3.4}.
The evaluation steps are as follows:
\vspace{1}\newline
1.\tab{3}{\em a} and {\em b} are evaluated, each producing
a value and a type.
\newline\tab{3}{\em Example:} {\em 2} evaluates to {\em 2} of type
\spadtype{Integer};
{\em 3.4} evaluates to {\em 3.4} of type \spadtype{Float}.
\vspace{1}\newline
2.\tab{3}Axiom then chooses a function {\em op} based on the
types of {\em a} and {\em b}.
\newline\tab{3}{\em Example:} The function {\em +: (D,D) -> D}
is chosen requiring a common type {\em D} for both arguments to {\em +}.
An operation called {\em resolve} determines the ‘smallest common
type’ \spadtype{Float}.
\vspace{1}\newline
3.\tab{3}If the argument types for the function are different from
those of {\em a} and {\em b},
then the system coerces
%\downlink{coerces}{Coercion}
the values to the argument types.

```

```

\newline\tab{3}{\em Example:} The integer {\em 2} is coerced to the
float {\em 2.0}.
\vspace{1}\newline
4.\tab{3}The function is then applied to the values of {\em a} and {\em b}
to produce the value for {\em a op b}.
\newline\tab{3}{\em Example:} The function {\em +: (D,D) -> D}, where
{\em D} = \spadtype{Float} is applied to {\em 2.0} and {\em 3.4} to
produce {\em 5.4}.
\vspace{1}\newline
Try it:
\example{2 + 3.4}
\endscroll
\autobuttons
\end{page}

\end{paste}\end{patch}
```

Multiple Derivatives I

— exdiff.ht —

```
\begin{page}{ExDiffMultipleI}{Multiple Derivatives I}
\beginscroll
When given a function of several variables, you may take derivatives
repeatedly and with respect to different variables.
The following command differentiates the function
 $\sin(x)/(x^2 + y^2)$  first with respect to  $x$  and then with
respect to  $y$ :
\spadpaste{differentiate(sin(x)/(x**2 + y**2),[x,y])}
As you can see, we first specify the function and then a list of
the variables of differentiation.
Variables may appear on the list more than once.
For example, the following command differentiates the same function with
respect to  $x$  and then twice with respect to  $y$ .
\spadpaste{differentiate(sin(x)/(x**2 + y**2),[x,y,y])}
\endscroll
\autobuttons
```

```

Exit

— exit.ht —

```

\begin{page}{ExitXmpPage}{Exit}
\beginscroll

A function that does not return directly to its caller has
\spadtype{Exit} as its return type.
The operation \spadfun{error} is an example of one which does not return
to its caller.
Instead, it causes a return to top-level.
\xtc{
}{
\spadpaste{n := 0 \bound{n}}
}
\xtc{
The function \userfun{gasp} is given return type \spadtype{Exit} since
it is guaranteed never to return a value to its caller.
}{
\begin{spadsrc}[\bound{gasp}\free{n}]
gasp(): Exit ==
  free n
  n := n + 1
  error "Oh no!"
\end{spadsrc}

```

```

}
\xtc{
The return type of \userfun{half} is determined by resolving the
types of the two branches of the \spad{if}.
}{
\begin{spadsrc}[\bound{half}\free{gasp}]
half(k) ==
  if odd? k then gasp()
  else k quo 2
\end{spadsrc}
}
\xtc{
Because
\userfun{gasp} has the return type \spadtype{Exit}, the type of
\spad{if} in \userfun{half} is resolved to be \spadtype{Integer}.
}{
\spadpaste{half 4 \free{half}\bound{app1}}
}
\xtc{
}{
\spadpaste{half 3 \free{half app1}\bound{app2}}
}
\xtc{
}{
\spadpaste{n \free{app2}}
}

```

For functions which return no value at all, use \spadtype{Void}.

See [\downlink{'User-Defined Functions, Macros and Rules'}](#)
[\ugUserPage](#) in Section 6\ignore{\ugUser} and

Integral of a Rational Function

— exint.ht —

```
\begin{page}{ExIntRationalFunction}{Integral of a Rational Function}
\beginscroll
The following fraction has a denominator which factors into
a quadratic and a quartic irreducible polynomial. The usual
partial fraction approach used by most other computer algebra
systems either fails or introduces expensive unneeded algebraic
numbers.
We use a factorization-free algorithm.
\spadpaste{integrate((x**2+2*x+1)/((x+1)**6+1),x)}
There are cases where algebraic numbers are absolutely necessary.
In that case the answer to the \spadfun{integrate} command will contain
symbols like \spad{\%}\%FO denoting the algebraic numbers used.
To find out what the definitions for these numbers is use the
\spadfun{definingPolynomial} operation on these numbers.
```

```
\spadpaste{integrate(1/(x**3+x+1),x) \bound{i}}
For example, if a symbol like \spad{\%\%F0} appears in the result of this last
integration, then \spad{definingPolynomial \%\%F0} will return the
polynomial that \spad{\%\%F0} is a root of. The next command isolates the
algebraic number from the expression and displays its defining polynomial.
\spadpaste{definingPolynomial(tower(\%).2::EXPR INT) \free{i}}

An Integral Which Does Not Exist

— exint.ht —

```

\begin{page}{ExIntNoSolution}{An Integral Which Does Not Exist}
\beginscroll
Most computer algebra systems use heuristics or table-driven
approaches to integration. When these systems cannot determine
the answer to an integration problem, they reply "I don't know".
Axiom uses a complete algorithm for integration.
It will conclusively prove that an integral
cannot be expressed in terms of elementary functions.
When Axiom returns an integral sign, it has proved
that no answer exists as an elementary function.

Details for integrating a function with a Hidden Algebraic Relation

— exint.ht —

```

\begin{page}{ExIntAlgebraicRelationExplain}
{Details for integrating a function with a Hidden Algebraic Relation}
\begin{scroll}
Steps taken for integration of:
\centerline{{\em f} := tan(atan(x)/3)}
\begin{items}
\item
1. Replace {\em f} by an equivalent algebraic function {\em g}
satisfying the algebraic relation:
\centerline{{\em g}**3 - 3*x*g - 3*g + x = 0}
\item
2. Integrate {\em g} using using this algebraic relation; this produces:
\centerline{{\em (24g**2 - 8)log(3g**2 - 1) + (81x**2 + 24)g**2 + 72xg - 27x**2 - 16}}
\centerline{{\em / (54g**2 - 18)}}
\item
3. Rationalize the denominator, producing:
\centerline{{\em (8log(3g**2-1) - 3g**2 + 18xg + 15)/18}}
\item
4. Replace {\em g} by the initial {\em f} to produce the final result:
\centerline{{\em (8log(3tan(atan(x/3))**2-1) - 3tan(atan(x/3))**2 -

Computing Limits

⇒ “notitle” (ExLimitTwoSided) [3.31](#) on page [420](#)

⇒ “notitle” (ExLimitOneSided) [3.31](#) on page [419](#)

— exlimit.ht —

```
\begin{page}{ExLimitBasic}{Computing Limits}
```

```

\beginscroll
To compute a limit, you must specify a functional expression,
a variable, and a limiting value for that variable.
For example, to compute the limit of  $(x^2 - 3x + 2)/(x^2 - 1)$ 
as  $x$  approaches 1, issue the following command:
\spadpaste{limit((x**2 - 3*x + 2)/(x**2 - 1),x = 1)}
% answer := -1/2
Since you have not specified a direction, Axiom will attempt
to compute a two-sided limit. Sometimes the limit when approached from
the left is different from the limit from the right.
\downlink{Example}{ExLimitTwoSided}. In this case, you may
wish to ask for a one-sided limit.

\begin{page}{ExLimitOneSided}{One-sided Limits}
\beginscroll
If you have a function which is only defined on one side of a particular value,
you may wish to compute a one-sided limit.
For instance, the function \spad{log(x)} is only defined to the right of zero,
i.e. for \spad{x > 0}.
Thus, when computing limits of functions involving \spad{log(x)}, you probably
will want a 'right-hand' limit.
Here's an example:
\spadpaste{limit(x * log(x),x = 0,"right")}
% answer := 0
When you do not specify \spad{right} or \spad{left} as an optional fourth
argument, the function \spadfun{limit} will try to compute a two-sided limit.
In the above case, the limit from the left does not exist, as Axiom
will indicate when you try to take a two-sided limit:
\spadpaste{limit(x * log(x),x = 0)}
% answer := [left = "failed",right = 0]
\endscroll

```

Two-sided Limits

— exlimit.ht —

```

\begin{page}{ExLimitTwoSided}{Two-sided Limits}
\begin{scroll}
A function may be defined on both sides of a particular value, but will
tend to different limits as its variable tends to that value from the
left and from the right.
We can construct an example of this as follows:

```

Since $\{\sqrt{y^2}\}$ is simply the absolute value of \sqrt{y} ,
the function $\sqrt{y^2}/y$

is simply the sign (+1 or -1) of the real number \sqrt{y} .

Therefore, $\sqrt{y^2}/y = -1$ for $\sqrt{y} < 0$ and

$\sqrt{y^2}/y = +1$ for $\sqrt{y} > 0$.

Watch what happens when we take the limit at $\sqrt{y} = 0$.

```
\spadpaste{limit(sqrt(y**2)/y,y = 0)}
```

```
% answer := [left = -1,right = 1]
```

The answer returned by Axiom gives both a 'left-hand' and a 'right-hand'
limit.

Here's another example, this time using a more complicated function:

```
\spadpaste{limit(sqrt(1 - cos(t))/t,t = 0)}
```

```
% answer := [left = -sqrt(1/2),right = sqrt(1/2)]
```

Real Limits vs. Complex Limits

— exlimit.ht —

```

\begin{page}{ExLimitRealComplex}{Real Limits vs. Complex Limits}
\begin{scroll}
When you use the function \spadfun{limit}, you will be taking the limit of a real
function of a real variable.
For example, you can compute
\spadpaste{limit(z * sin(1/z),z = 0)}
Axiom returns \spad{0} because as a function of a real variable
\spad{sin(1/z)} is always between \spad{-1} and \spad{1}, so \spad{z * sin(1/z)}
tends to \spad{0} as \spad{z} tends to \spad{0}.
However, as a function of a complex variable, \spad{sin(1/z)} is badly
behaved around \spad{0}
(one says that \spad{sin(1/z)} has an 'essential singularity' at \spad{z = 0}).
When viewed as a function of a complex variable, \spad{z * sin(1/z)}
does not approach any limit as \spad{z} tends to \spad{0} in the complex plane.
Axiom indicates this when we call the function \spadfun{complexLimit}:
\spadpaste{complexLimit(z * sin(1/z),z = 0)}
\end{scroll}
\autobuttons
\end{page}

\begin{patch}{ExLimitRealComplexPatch1}

Complex Limits at Infinity

— exlimit.ht —

```

\begin{page}{ExLimitComplexInfinite}{Complex Limits at Infinity}
\begin{scroll}
You may also take complex limits at infinity, i.e. limits of a function of
\spad{z} as \spad{z} approaches infinity on the Riemann sphere.
Use the symbol \spad{\%infinity} to denote 'complex infinity'.
Also, to compute complex limits rather than real limits, use the
function \spadfun{complexLimit}.
Here is an example:
\spadpaste{complexLimit((2 + z)/(1 - z),z = \%infinity)}
In many cases, a limit of a real function of a real variable will exist
when the corresponding complex limit does not.
For example:
\spadpaste{limit(sin(x)/x,x = \%plusInfinity)}
\spadpaste{complexLimit(sin(x)/x,x = \%infinity)}
\end{scroll}

Basic Arithmetic Operations on Matrices

— exmatrix.ht —

```

\begin{page}{ExMatrixBasicFunction}
{Basic Arithmetic Operations on Matrices}
\beginscroll
You can create a matrix using the function \spadfun{matrix}.
The function takes a list of lists of elements of the ring and
produces a matrix whose \spad{i}th row contains the elements of
the \spad{i}th list. For example:
\spadpaste{m1 := matrix([[1,-2,1],[4,2,-4]]) \bound{m1}}
\spadpaste{m2 := matrix([[1,0,2],[20,30,10],[0,200,100]]) \bound{m2}}
\spadpaste{m3 := matrix([[1,2,3],[2,4,6]]) \bound{m3}}
Some of the basic arithmetic operations on matrices are:
\spadpaste{m1 + m3 \free{m1} \free{m3}}
\spadpaste{100 * m1 \free{m1}}
\spadpaste{m1 * m2 \free{m1} \free{m2}}
\spadpaste{-m1 + m3 * m2 \free{m1} \free{m2} \free{m3}}
You can also multiply a matrix and a vector provided
that the matrix and vector have compatible dimensions.
\spadpaste{m3 *vector([1,0,1]) \free{m3}}
However, the dimensions of the matrices must be compatible in order for
Axiom to perform an operation - otherwise an error message will occur.

Constructing new Matrices

— exmatrix.ht —

```

\begin{page}{ExConstructMatrix}{Constructing new Matrices}
\begin{scroll}
A number of functions exist for constructing new matrices from existing ones.

If you want to create a matrix whose entries are 0 except on the main
diagonal you can use \spadfun{diagonalMatrix}.
This function takes a list of ring elements as an argument and returns a
square matrix which has these elements on the main diagonal.
Consider the following example:
\spadpaste{diagonalMatrix([1,2,3,2,1])}

The function \spadfun{subMatrix}(\spad{a},\spad{i},\spad{j},\spad{k},\spad{l})
constructs a new matrix
consisting of rows \spad{i} through \spad{j} and columns \spad{k} through

```

\spad{1} of \spad{a} , inclusive.
\spadpaste{subMatrix(matrix([[0,1,2,3,4],[5,6,7,8,9],[10,11,12,13,14]]),
1,3,2,4)}

The functions \spadfun{horizConcat} and \spadfun{vertConcat}
concatenate matrices
horizontally and vertically, respectively.
\spadpaste{horizConcat(matrix([[1,2,3],[6,7,8]]),
matrix([[11,12,13],[55,77,88]])) }
\spadpaste{vertConcat(matrix([[1,2,3],[6,7,8]]),
matrix([[11,12,13],[55,77,88]])) }

The function \spadfunX{setsubMatrix}(\spad{a},\spad{i},\spad{k},\spad{b})
replaces the submatrix of \spad{a}
starting at row \spad{i} and column \spad{k} with the elements of the
matrix i\spad{b}.
\spadpaste{b:=matrix([[0,1,2,3,4],[5,6,7,8,9],[10,11,12,13,14]]) \bound{b}}
\spadpaste{setsubMatrix!(b,1,1,transpose(subMatrix(b,1,3,1,3)))\free{b}}
changes the submatrix of \spad{b} consisting of the first 3 rows and columns
to its transpose.

— expr.ht —

```
\begin{page}{ExpressionXmpPage}{Expression}
\beginscroll

\axiomType{Expression} is a constructor that creates domains whose
objects can have very general symbolic forms.
Here are some examples:
\xtc{
This is an object of type \axiomType{Expression Integer}.
}{
\spadpaste{sin(x) + 3*cos(x)**2}
}
\xtc{
This is an object of type \axiomType{Expression Float}.
}{
\spadpaste{tan(x) - 3.45*x}
}
\xtc{
This object contains symbolic function applications, sums,
products, square roots, and a quotient.
}{
\spadpaste{(tan sqrt 7 - sin sqrt 11)**2 / (4 - cos(x - y))}
}
As you can see, \axiomType{Expression} actually takes an argument
domain.
The {\it coefficients} of the terms within the expression belong
to the argument domain.
\axiomType{Integer} and \axiomType{Float}, along with
\axiomType{Complex Integer} and \axiomType{Complex Float}
are the most common coefficient domains.
\xtc{
The choice of whether
```

to use a `\axiomType{Complex}` coefficient domain or not is important since Axiom can perform some simplifications on real-valued objects

```

}{
\spadpaste{log(exp x)@Expression(Integer)}
}
\xtc{
... which are not valid on complex ones.
}{
\spadpaste{log(exp x)@Expression(Complex Integer)}
}
\xtc{
Many potential coefficient domains, such as
\axiomType{AlgebraicNumber}, are not usually used because
\axiomType{Expression} can subsume them.
}{
\spadpaste{sqrt 3 + sqrt(2 + sqrt(-5)) \bound{algnum1}}
}
\xtc{
}{
\spadpaste{\% :: Expression Integer \free{algnum1}}
}

```

Note that we sometimes talk about “an object of type `\axiomType{Expression}`.” This is not really correct because we should say, for example, “an object of type `\axiomType{Expression Integer}`” or “an object of type `\axiomType{Expression Float}`.” By a similar abuse of language, when we refer to an “expression” in this section we will mean an object of type `\axiomType{Expression R}` for some domain `\bf R`.

The Axiom documentation contains many examples of the use of `\axiomType{Expression}`. For the rest of this section, we’ll give you some pointers to those examples plus give you some idea of how to manipulate expressions.

It is important for you to know that `\axiomType{Expression}` creates domains that have category `\axiomType{Field}`. Thus you can invert any non-zero expression and you shouldn’t expect an operation like `\axiomFun{factor}` to give you much information.

You can imagine expressions as being represented as quotients of “multivariate” polynomials where the “variables” are kernels (see `\downlink{‘Kernel’}{KernelXmpPage}\ignore{Kernel}`).

A kernel can either be a symbol such as `\axiom{x}` or a symbolic function application like `\axiom{sin(x + 4)}`.

The second example is actually a nested kernel since the argument to `\axiomFun{sin}` contains the kernel `\axiom{x}`.

```

\xtc{
}{
\spadpaste{height mainKernel sin(x + 4)}
}

```

```
}
Actually, the argument to \axiomFun{sin} is an expression, and so
the structure of \axiomType{Expression} is recursive.
\downlink{'Kernel'}{KernelXmpPage}\ignore{Kernel}
demonstrates how to extract the kernels in an
expression.
```

Use the Hyperdoc Browse facility to see what operations are applicable to expression.

At the time of this writing, there were 262 operations with 147 distinct name in \axiomType{Expression Integer}. For example, \axiomFunFrom{number}{Expression} and \axiomFunFrom{denom}{Expression} extract the numerator and denominator of an expression.

```
\xctc{
}{
\spadpaste{e := (sin(x) - 4)**2 / ( 1 - 2*y*sqrt(- y) ) \bound{e}}
}
\xctc{
}{
\spadpaste{number e \free{e}}
}
\xctc{
}{
\spadpaste{denom e \free{e}}
}
\xctc{
```

Use \axiomFunFrom{D}{Expression} to compute partial derivatives.

```
}{
\spadpaste{D(e, x) \free{e}}
}
\xctc{
See \downlink{'Derivatives'}{ugIntroCalcDerivPage} in Section 1.12
\ignore{ugIntroCalcDeriv}
for more examples of expressions and derivatives.
}{
\spadpaste{D(e, [x, y], [1, 2]) \free{e}}
}
```

See \downlink{'Limits'}{ugIntroCalcLimitsPage} in Section 1.10\ignore{ugIntroCalcLimits} and \downlink{'Series'}{ugIntroSeriesPage} in Section 1.11 \ignore{ugIntroSeries}

for more examples of expressions and calculus.

Differential equations involving expressions are discussed in

\downlink{'Solution of Differential Equations'}{ugProblemDEQPage} in Section 8.10\ignore{ugProblemDEQ}.

Chapter 8 has many advanced examples: see

\downlink{'Integration'}{ugProblemIntegrationPage} in Section 8.8\ignore{ugProblemIntegration}

for a discussion of Axiom's integration facilities.

When an expression involves no ‘symbol kernels’ (for example, `\axiom{x}`), it may be possible to numerically evaluate the expression.

```
\xtc{
```

If you suspect the evaluation will create a complex number, use `\axiomFun{complexNumeric}`.

```
}{
```

```
\spadpaste{complexNumeric(cos(2 - 3*%i))}
```

```
}
```

```
\xtc{
```

If you know it will be real, use `\axiomFun{numeric}`.

```
}{
```

```
\spadpaste{numeric(tan 3.8)}
```

```
}
```

The `\axiomFun{numeric}` operation will display an error message if the evaluation yields a value with a non-zero imaginary part.

Both of these operations have an optional second argument

`\axiom{n}` which specifies that the accuracy of the approximation be up to `\axiom{n}` decimal places.

When an expression involves no ‘symbolic application’ kernels, it may be possible to convert it a polynomial or rational function in the variables that are present.

```
\xtc{
```

```
}{
```

```
\spadpaste{e2 := cos(x**2 - y + 3) \bound{e2}}
```

```
}
```

```
\xtc{
```

```
}{
```

```
\spadpaste{e3 := asin(e2) - %pi/2 \free{e2}\bound{e3}}
```

```
}
```

```
\xtc{
```

```
}{
```

```
\spadpaste{e3 :: Polynomial Integer \free{e3}}
```

```
}
```

```
\xtc{
```

This also works for the polynomial types where specific variables and their ordering are given.

```
}{
```

```
\spadpaste{e3 :: DMP([x, y], Integer) \free{e3}}
```

```
}
```

Finally, a certain amount of simplification takes place as expressions are constructed.

```
\xtc{
```

```
}{
```

```
\spadpaste{sin %pi}
```

```
}
```

```
\xtc{
```

```

}{
\spadpaste{cos(\%pi / 4)}
}
\xtc{
For simplifications that involve multiple terms of the expression,
use \axiomFun{simplify}.
}{
\spadpaste{tan(x)**6 + 3*tan(x)**4 + 3*tan(x)**2 + 1 \bound{tan6}}
}
\xtc{
}{
\spadpaste{simplify \% \free{tan6}}
}
See \downlink{‘‘Rules and Pattern Matching’’}{ugUserRulesPage} in
Section 6.21\ignore{ugUserRules} for examples of how to write your own
rewrite rules for expressions.

\end{paste}\end{patch}

```

Plotting Plane Algebraic Curves

— `explot2d.ht` —

```
\begin{page}{ExPlot2DAlgebraic}{Plotting Plane Algebraic Curves}
\beginscroll
Axiom can also plot plane algebraic curves (i.e. curves defined by
an equation  $f(x,y) = 0$ ) provided that the curve is non-singular
in the region to be sketched.
Here's an example:
\graphpaste{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
Here the region of the sketch is  $-2 \leq x \leq 2, -2 \leq y \leq 1$ .
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot2DAlgebraicPatch1}
\begin{paste}{ExPlot2DAlgebraicFull1}{ExPlot2DAlgebraicEmpty1}
\pastebutton{ExPlot2DAlgebraicFull1}{\hidepaste}
\tab{5}\spadgraph{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
\center{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/explot2dalgebraic1.view/image}}{viewalone\space{}}}
\end{paste}\end{patch}

\begin{paste}{ExPlot2DAlgebraicEmpty1}{ExPlot2DAlgebraicPatch1}
\pastebutton{ExPlot2DAlgebraicEmpty1}{\showpaste}
\tab{5}\spadgraph{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
\end{paste}\end{patch}
```

3.35 `explot3d.ht`

Plotting Functions of Two Variables

— `explot3d.ht` —

```
\begin{page}{ExPlot3DFunctions}{Plotting Functions of Two Variables}
\beginscroll
To plot a function  $z = f(x,y)$ , you need only specify the function
and the intervals over which the dependent variables will range.
```

For example, here's how you plot the function $z = \cos(xy)$ as the variables x and y both range between -3 and 3 :

```
\graphpaste{draw(cos(x*y),x = -3..3,y = -3..3)}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot3DFunctionsPatch1}
\begin{paste}{ExPlot3DFunctionsFull1}{ExPlot3DFunctionsEmpty1}
\pastebutton{ExPlot3DFunctionsFull1}{\hidepaste}
\tab{5}\spadgraph{draw(cos(x*y),x = -3..3,y = -3..3)}
\center{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/exploit3dfunctions1.view/image}}{viewa}
\end{paste}\end{patch}

\begin{patch}{ExPlot3DFunctionsEmpty1}
\begin{paste}{ExPlot3DFunctionsEmpty1}{ExPlot3DFunctionsPatch1}
\pastebutton{ExPlot3DFunctionsEmpty1}{\showpaste}
\tab{5}\spadgraph{draw(cos(x*y),x = -3..3,y = -3..3)}
\end{paste}
\end{patch}
```

Plotting Parametric Surfaces

— `explot3d.ht` —

```
\begin{page}{ExPlot3DParametricSurface}{Plotting Parametric Surfaces}
\beginscroll
To plot a parametric surface defined by  $x = f(u,v)$ ,
 $y = g(u,v)$ ,  $z = h(u,v)$ , specify the functions
 $f(u,v)$ ,  $g(u,v)$ , and  $h(u,v)$ 
as arguments of the function 'surface', then give
the intervals over which  $u$  and  $v$  are to range.
With parametric surfaces, we can create some interesting graphs.
Here's an egg:
\graphpaste{draw(surface(5*sin(u)*cos(v),4*sin(u)*sin(v),3*cos(u)),
u=0..%pi,v=0..2*%pi)}
Here's a cone:
\graphpaste{draw(surface(u*cos(v),u*sin(v),u),u=0..4,v=0..2*%pi)}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot3DParametricSurfacePatch1}
\begin{paste}{ExPlot3DParametricSurfaceFull1}{ExPlot3DParametricSurfaceEmpty1}
\pastebutton{ExPlot3DParametricSurfaceFull1}{\hidepaste}
```

```

\tab{5}\spadgraph{draw(curve(cos(t),sin(t),t),t=0..6)}

\end{paste}
\end{patch}

```

3.36 expose.ht

Exposure

— expose.ht —

```

\begin{page}{helpExpose}{Exposure}
\beginscroll
Exposure determines what part of the Axiom library
is available to you when using Axiom.
At any time during your interactive Axiom session,
each constructor is either {\em exposed} or {\em unexposed}.
If a constructor is exposed, its operations are available to
the interpreter and therefore to you.
If a constructor is unexposed, the operations are not seen
by the interpreter and thus not available to you.
\par
If you are a beginner, you may only want
basic parts of the library exposed.
If you are an expert, you may want to have all parts of the

```

library exposed.

If you have an application that requires only a segment of the library, you may want to arrange to expose only that segment for your use.

```
\par
\endscroll
Additional Information:
\beginmenu
\menulink{What}{ExposureDef}\tab{8}What is an exposure group?
\menulink{System}{ExposureSystem}\tab{8}What exposure groups are
system defined?
% \menulink{User}{ExposureUser}\tab{8}How can I define my own?
\menulink{Details}{ExposureDetails}\tab{8}Some details on exposure
\endmenu
\end{page}
```

System Defined Exposure Groups

— expose.ht —

```
\begin{page}{ExposureSystem}{System Defined Exposure Groups}
\beginscroll
Exposure is defined by {\em groups}.
Groups have names.
Seven exposure groups are system-defined:\beginmenu
\item\tab{3}{\em current}\tab{12}The currently active exposure group
\item\tab{3}{\em basic}\tab{12}The default value of {\em current}
\item\tab{3}{\em category}\tab{13}Category constructors not in {\em basic}
\item\tab{3}{\em domain}\tab{13}Domain constructors not in {\em basic}
\item\tab{3}{\em package}\tab{13}Package constructors not in {\em basic}
\item\tab{3}{\em default}\tab{13}Default constructors not in {\em basic}
\item\tab{3}{\em hidden}\tab{13}All constructors not in {\em basic}
\item\tab{3}{\em naglink}\tab{13}All constructors used in the Axiom NAG Link
\endmenu
\par
When you first use Axiom, the {\em current} exposure group is
set to {\em basic} and {\em naglink}. Using Hyperdoc or the system command
{\em expose}, you may
change the current exposure group by
adding or dropping constructors or by setting {\em current}
to an exposure group you have created.
\endscroll

```

What is an Exposure Group?

— expose.ht —

```
\begin{page}{ExposureDef}{What is an Exposure Group?}
\beginscroll
\par
An exposure group is a list of constructors to be exposed.
Those constructors on the list are exposed;
those not on the list are not exposed.
The library contains 4 kinds of constructors intuitively described as follows:
\beginmenu
\item\menuitemstyle{}{\em domain}\tab{10}Describes computational objects
and functions defined on these objects
\item\menuitemstyle{}{\em package}\tab{10}Describes functions which will
work over a variety of domains
\item\menuitemstyle{}{\em category}\tab{10}Names a set of operations
\item\menuitemstyle{}{\em default}\tab{10}Provides default functions for
a category
\endmenu

An exposure group is defined by three lists:
\beginmenu
\item\menuitemstyle{}{\em groups}
\tab{13}A list of other (more basic) groups
\item\menuitemstyle{}{\em additions}
\tab{13}A list of explicit constructors to be included
\item\menuitemstyle{}{\em subtractions}
\tab{13}A list of explicit constructors to be dropped
\endmenu
You can define your own exposure groups: give them names and define the
three above lists to be anything you like.
Using Hyperdoc, you can conveniently edit your exposure groups,
install them as the {\em current} exposure, and so on.
\endscroll
\end{page}
```

Details on Exposure

— expose.ht —

```
\begin{page}{ExposureDetails}{Details on Exposure}
\beginscroll
Exposure is generally defined by the set of domain and package
constructors you want to have available. Category and default
constructors are generally implied. A category constructor is exposed
if mentioned by {\em any} other constructor (including another
category). A default constructor is exposed if its corresponding
category constructor is exposed.
\par
If you explicitly add a domain or package
constructor, its name will be put in an {\em Additions} list.
The system will also add automatically to the {\em Additions} list
any category explicitly exported by that domain or package.
If that category has a corresponding default constructor, that
default constructor will also be added as well.
\par
If you like, you can explicitly drop a constructor. Any such name is
added to the {\em Subtractions} list. The system will drop this name
from the {\em Additions} list if it appears.
\par
If the package or domain takes arguments from an unexported
domain or declares that its arguments can come from a domain
which is a member of an unexported category, these constructors
will {\em not} be added.

Converting Expressions to Series

— exseries.ht —

```
\begin{page}{ExSeriesConvert}{Converting Expressions to Series}
\beginscroll
You can convert a functional expression to a power series by using the
function 'series'.
Here's an example:
```

```
\spadpaste{series(sin(a*x),x = 0)}
This causes {\em sin(a*x)} to be expanded in powers of {\em (x - 0)},
that is, in powers of {\em x}.
You can have {\em sin(a*x)} expanded in powers of {\em (a - \%pi/4)} by
issuing the following command:
\spadpaste{series(sin(a*x),a = \%pi/4)}
\endscroll
\autobuttons
\end{page}
```

```
\begin{patch}{ExSeriesConvertPatch1}
\begin{paste}{ExSeriesConvertFull1}{ExSeriesConvertEmpty1}
\pastebutton{ExSeriesConvertFull1}{\hidepaste}
\begin{tabular}{l}
\spadcommand{series(sin(a*x),x = 0)}
\end{tabular}
\end{paste}
\end{patch}
```

$$\begin{aligned}

3.38 exsum.ht

Summing the Entries of a List I

— exsum.ht —

```

\begin{page}{ExSumListEntriesI}{Summing the Entries of a List I}
\begin{scroll}
In Axiom, you can create lists of consecutive integers by giving the
first and last entries of the list.
Here's how you create a list of the integers between {\em 1} and {\em 15}:
\spadpaste{[i for i in 1..15]}
To sum the entries of a list, simply put {\em +/} in front of the list.
For example, the following command will sum the integers from 1 to 15:
\spadpaste{reduce(+,[i for i in 1..15])}
\end{scroll}
\autobuttons
\end{page}

Closed Form Summations

— exsum.ht —

```
\begin{page}{ExSumClosedForm}{Closed Form Summations}
\begin{scroll}
In a previous example, we found the sum of the squares of the integers
between {\em 5} and {\em 20}.
We can also use Axiom to find a formula for the sum of the squares of
the integers between {\em a} and {\em b}, where {\em a} and {\em b}
are integers which will remain
unspecified:
\spadpaste{s := sum(k**2,k = a..b) \bound{s}}
{\em sum(k**2,k = a..b)} returns the sum of {\em k**2} as the index {\em k}
runs from {\em a} to {\em b}.
Let's check our answer in one particular case by substituting specific values
for {\em a} and {\em b} in our formula:
% Warning: syntax for polynomial evaluation will probably change.
\spadpaste{eval(s,[a,b],[1,25]) \free{s}}
\spadpaste{reduce(+,[i**2 for i in 1..25])}
\end{scroll}
\autobuttons

Sums of Cubes

— exsum.ht —

```

\begin{page}{ExSumCubes}{Sums of Cubes}
\beginscroll
Here's a cute example.
First compute the sum of the cubes from {\em 1} to {\em n}:
\spadpaste{sum(k**3,k = 1..n)}
Then compute the square of the sum of the integers from {\em 1} to {\em n}:
\spadpaste{sum(k,k = 1..n) ** 2}

```

The answers are the same.

3.39 farray.ht

FlexibleArray

⇒ “notitle” (OneDimensionalArrayXmpPage) [3.4](#) on page [138](#)

⇒ “notitle” (VectorXmpPage) [3.114](#) on page [1351](#)

— **farray.ht** —

```
\begin{page}{FlexibleArrayXmpPage}{FlexibleArray}
\beginscroll
```

The `\spadtype{FlexibleArray}` domain constructor creates one-dimensional arrays of elements of the same type. Flexible arrays are an attempt to provide a data type that has the best features of both one-dimensional arrays (fast, random access to elements) and lists (flexibility). They are implemented by a fixed block of storage. When necessary for expansion, a new, larger block of storage is allocated and the elements from the old storage area are copied into the new block.

Flexible arrays have available most of the operations provided by `\spadtype{OneDimensionalArray}` (see `\downlink{‘OneDimensionalArray’}{OneDimensionalArrayXmpPage}` `\ignore{OneDimensionalArray}` and `\downlink{‘Vector’}{VectorXmpPage}\ignore{Vector}`). Since flexible arrays are also of category `\spadtype{ExtensibleLinearAggregate}`, they have operations `\spadfunX{concat}`, `\spadfunX{delete}`, `\spadfunX{insert}`, `\spadfunX{merge}`, `\spadfunX{remove}`, `\spadfunX{removeDuplicates}`, and `\spadfunX{select}`. In addition, the operations `\spadfun{physicalLength}` and `\spadfunX{physicalLength}` provide user-control over expansion and contraction.

```
\xctc{
A convenient way to create a flexible array is to apply
the operation \spadfun{flexibleArray} to a list of values.
}{
\spadpaste{flexibleArray [i for i in 1..6]}
}
\xctc{
Create a flexible array of six zeroes.
}{
\spadpaste{f : FARRAY INT := new(6,0)\bound{f}}
}
\xctc{
For \texht{$i=1\ldots 6$}{i = 1..6},
set the \eth{\smath{i}} element to \smath{i}.
Display \spad{f}.
}{
\spadpaste{for i in 1..6 repeat f.i := i; f\bound{f1}\free{f}}
}
\xctc{
Initially, the physical length is the same as the number of elements.
}{
\spadpaste{physicalLength f\free{f1}}
}
\xctc{
```

```

Add an element to the end of \spad{f}.
}{
\spadpaste{concat!(f,11)\bound{f2}\free{f1}}
}
\xtc{
See that its physical length has grown.
}{
\spadpaste{physicalLength f\free{f2}}
}
\xtc{
Make \spad{f} grow to have room for \spad{15} elements.
}{
\spadpaste{physicalLength!(f,15)\bound{f3}\free{f2}}
}
\xtc{
Concatenate the elements of \spad{f} to itself.
The physical length allows room for three more values at the end.
}{
\spadpaste{concat!(f,f)\bound{f4}\free{f3}}
}
\xtc{
Use \spadfunX{insert} to add an element to the front of
a flexible array.
}{
\spadpaste{insert!(22,f,1)\bound{f5}\free{f4}}
}
\xtc{
Create a second flexible array from \spad{f} consisting of the
elements from index 10 forward.
}{
\spadpaste{g := f(10..)\bound{g}\free{f5}}
}
\xtc{
Insert this array at the front of \spad{f}.
}{
\spadpaste{insert!(g,f,1)\bound{g1}\free{g f5}}
}
\xtc{
Merge the flexible array \spad{f} into \spad{g} after sorting each in place.
}{
\spadpaste{merge!(sort! f, sort! g)\bound{f6}\free{g f5}}
}
\xtc{
Remove duplicates in place.
}{
\spadpaste{removeDuplicates! f\bound{f7}\free{f6}}
}
\xtc{
Remove all odd integers.
}{

```

```

\spadpaste{select!(i +-> even? i,f)\bound{f8}\free{f7}}
}
\xtc{
All these operations have shrunk the physical length of \spad{f}.
}{
\spadpaste{physicalLength f\free{b8}}
}
\xtc{
To force Axiom not to shrink flexible arrays call the
\spadfun{shrinkable} operation with the argument \axiom{false}.
You must package call this operation.
The previous value is returned.
}{
\spadpaste{shrinkable(false)\$FlexibleArray(Integer)}
}

```

The `\spadtype{File(S)}` domain provides a basic interface to read and write values of type `\spad{S}` in files.

```

\xtc{
Before working with a file, it must be made accessible to Axiom with
the \spadfunFrom{open}{File} operation.
}{
\spadpaste{ifile:File List Integer:=open("/tmp/jazz1","output")
\bound{ifile}}
}
The \spadfunFrom{open}{File} function arguments are a \spadtype{FileName}
and a \spadtype{String} specifying the mode.
If a full pathname is not specified, the current default directory is
assumed.
The mode must be one of \spad{"input"} or \spad{"output"}.
If it is not specified, \spad{"input"} is assumed.
Once the file has been opened, you can read or write data.
\xtc{
The operations \spadfunFromX{read}{File} and \spadfunFromX{write}{File}
are provided.
}{
\spadpaste{write!(ifile, [-1,2,3])          \free{ifile}\bound{ifile1}}
}
\xtc{
}{
\spadpaste{write!(ifile, [10,-10,0,111]) \free{ifile1}\bound{ifile2}}
}
\xtc{
}{
\spadpaste{write!(ifile, [7])              \free{ifile2}\bound{ifile3}}
}
\xtc{
You can change from writing to reading (or vice versa)
by reopening a file.
}{

\beginscroll
  Axiom provides two kinds of floating point numbers.
  The domain \spadtype{Float} (abbreviation \spadtype{FLOAT})
  implements a model of arbitrary
  precision floating point numbers.
  The domain \spadtype{DoubleFloat} (abbreviation \spadtype{DFLOAT})
  is intended to make available
  hardware floating point arithmetic in Axiom.
```

The actual model of floating point that `\spadtype{DoubleFloat}` provides is system-dependent.

For example, on the IBM system 370 Axiom uses IBM double precision which has fourteen hexadecimal digits of precision or roughly sixteen decimal digits.

Arbitrary precision floats allow the user to specify the precision at which arithmetic operations are computed.

Although this is an attractive facility, it comes at a cost.

Arbitrary-precision floating-point arithmetic typically takes twenty to two hundred times more time than hardware floating point.

For more information about Axiom's numeric and graphic facilities, see

Introduction to Float

— float.ht —

`\begin{page}{ugxFloatIntroPage}{Introduction to Float}`

`\beginscroll`

Scientific notation is supported for input and output of floating point numbers.

A floating point number is written as a string of digits containing a decimal point optionally followed by the letter “`{\tt E}`”, and then the exponent.

`\xctc{`

We begin by doing some calculations using arbitrary precision floats.

The default precision is twenty decimal digits.

```

}{
\spadpaste{1.234}
}
\xtc{
A decimal base for the exponent is assumed, so the number
\spad{1.234E2} denotes
\texht{ $1.234 \cdot 10^2$ }{\spad{1.234 * 10**2}}.
}{
\spadpaste{1.234E2}

\xtc{
The precision is only limited by the computer memory available.
Calculations at 500 or more digits of precision are not difficult.
}{
\spadpaste{digits 500 \bound{d1000}}
}
\xtc{
}{
\spadpaste{pi()\$Float \free{d1000}}
}
\xtc{
Reset \spadfunFrom{digits}{Float} to its default value.
}{
\spadpaste{digits 20}
}
Numbers of type \spadtype{Float} are represented as a record of two
integers, namely, the mantissa and the exponent where the base of the
exponent is binary.
That is, the floating point number \spad{(m,e)} represents the number
\text{$m \cdot 2^e$}{\spad{m * 2**e}}.
A consequence of using a binary base is that decimal numbers can not, in
general, be represented exactly.

Output Functions

— float.ht —

```

\begin{page}{ugxFloatOutputPage}{Output Functions}
\beginscroll

A number of operations exist for specifying how
numbers of type \spadtype{Float} are to be
displayed.
By default, spaces are inserted every ten digits in the
output for readability.\footnote{Note that you cannot include spaces
in the input form of a floating point number, though you can use
underscores.}

\xtc{
Output spacing can be modified with the \spadfunFrom{outputSpacing}{Float}
operation.
This inserts no spaces and then displays the value of \spad{x}.
}{
\spadpaste{outputSpacing 0; x := sqrt 0.2 \bound{x}\bound{os0}}
}

```

```

\xtc{
Issue this to have the spaces inserted every \spad{5} digits.
}{
\spadpaste{outputSpacing 5; x \bound{os5}\free{x}}
}
\xtc{
By default, the system displays floats in either fixed format
or scientific format, depending on the magnitude of the number.
}{
\spadpaste{y := x/10**10 \bound{y}\free{x os5}}
}
\xtc{
A particular format may be requested with the operations
\spadfunFrom{outputFloating}{Float} and \spadfunFrom{outputFixed}{Float}.
}{
\spadpaste{outputFloating(); x \bound{of} \free{os5 x}}
}
\xtc{
}{
\spadpaste{outputFixed(); y \bound{ox} \free{os5 y}}
}
\xtc{
Additionally, you can ask for \spad{n} digits to be displayed after the
decimal point.
}{
\spadpaste{outputFloating 2; y \bound{of2} \free{os5 y}}
}
\xtc{
}{
\spadpaste{outputFixed 2; x \bound{ox2} \free{os5 x}}
}
\xtc{
This resets the output printing to the default behavior.
}{
\spadpaste{outputGeneral()}
}

\begin{page}{\ugxFloatHilbertPage}
{An Example: Determinant of a Hilbert Matrix}
\beginscroll

Consider the problem of computing the determinant of a  $10$  by  $10$ 
Hilbert matrix.
The  $\text{entry}$  of a Hilbert matrix is given by
 $\frac{1}{(i+j+1)}$ .

\labelSpace{2pc}
\xtc{
First do the computation using rational numbers to obtain the
exact result.
}{
\spadpaste{a: Matrix Fraction Integer :=
matrix [[1/(i+j+1) for j in 0..9] for i in 0..9] \bound{a}}
}
\xtc{
This version of \spadfunFrom{determinant}{Matrix} uses Gaussian
elimination.
}{

3.42 fname.ht

FileName

— fname.ht —

```

\begin{page}{FileNameXmpPage}{FileName}
\begin{scroll}

```

The `\spadtype{FileName}` domain provides an interface to the computer's file system.

Functions are provided to manipulate file names and to test properties of files.

The simplest way to use file names in the Axiom interpreter is to rely on conversion to and from strings.

The syntax of these strings depends on the operating system.

```
\xtec{
}{
\spadpaste{fn: FileName \bound{fndecl}}
}
\xtec{
On AIX, this is a proper file syntax:
}{
\spadpaste{fn := "/spad/src/input/fname.input" \free{fndecl}\bound{fn}}
}
```

Although it is very convenient to be able to use string notation for file names in the interpreter, it is desirable to have a portable way of creating and manipulating file names from within programs.

```
\xtec{
A measure of portability is obtained by considering a file name
to consist of three parts: the {\it directory}, the {\it name},
and the {\it extension}.
}{
\spadpaste{directory fn \free{fn}}
}
\xtec{
}{
\spadpaste{name fn \free{fn}}
}
\xtec{
}{
\spadpaste{extension fn \free{fn}}
}
```

The meaning of these three parts depends on the operating system.

For example, on CMS the file \spad{"SPADPROF INPUT M"} would have directory \spad{"M"}, name \spad{"SPADPROF"} and extension \spad{"INPUT"}.

```
\xtec{
It is possible to create a filename from its parts.
}{
\spadpaste{fn := filename("/u/smwatt/work", "fname", "input")
\free{fndecl}\bound{fn1}}
}
\xtec{
When writing programs, it is helpful to refer to directories via
variables.
}{
\spadpaste{objdir := "/tmp" \bound{objdir}}
}
\xtec{
}{
\spadpaste{fn := filename(objdir, "table", "spad")
\free{fndecl,objdir}\bound{fn2}}
```

```

}
\xtc{
If the directory or the extension is given as an empty string, then
a default is used. On AIX, the defaults are the current directory
and no extension.
}{
\spadpaste{fn := filename("", "letter", "") \free{fndecl}\bound{fn3}}
}

```

Three tests provide information about names in the file system.

```

\xtc{
The \spadfunFrom{exists?}{FileName} operation tests whether
the named file exists.
}{
\spadpaste{exists? "/etc/passwd"}
}
\xtc{
The operation \spadfunFrom{readable?}{FileName} tells whether the named
file can be read. If the file does not exist, then it cannot be read.
}{
\spadpaste{readable? "/etc/passwd"}
}
\xtc{
}{
\spadpaste{readable? "/etc/security/passwd"}
}
\xtc{
}{
\spadpaste{readable? "/ect/passwd"}
}
\xtc{
Likewise, the operation \spadfunFrom{writable?}{FileName}
tells whether the named file
can be written.
If the file does not exist, the test is determined
by the properties of the directory.
}{
\spadpaste{writable? "/etc/passwd"}
}
\xtc{
}{
\spadpaste{writable? "/dev/null"}
}
\xtc{
}{
\spadpaste{writable? "/etc/DoesNotExist"}
}
\xtc{
}{
\spadpaste{writable? "/tmp/DoesNotExist"}
}

```

}

The `\spadfunFrom{new}{FileName}` operation constructs the name of a new writable file.

The argument sequence is the same as for `\spadfunFrom{filename}{FileName}`, except that the name part is actually a prefix for a constructed unique name.

`\xtc{`

The resulting file is in the specified directory with the given extension, and the same defaults are used.

```
\begin{page}{FactoredXmpPage}{Factored}
\beginscroll
```

`\spadtype{Factored}` creates a domain whose objects are kept in factored form as long as possible.

Thus certain operations like `\spadopFrom{*}{Factored}` (multiplication) and `\spadfunFrom{gcd}{Factored}` are relatively easy to do.

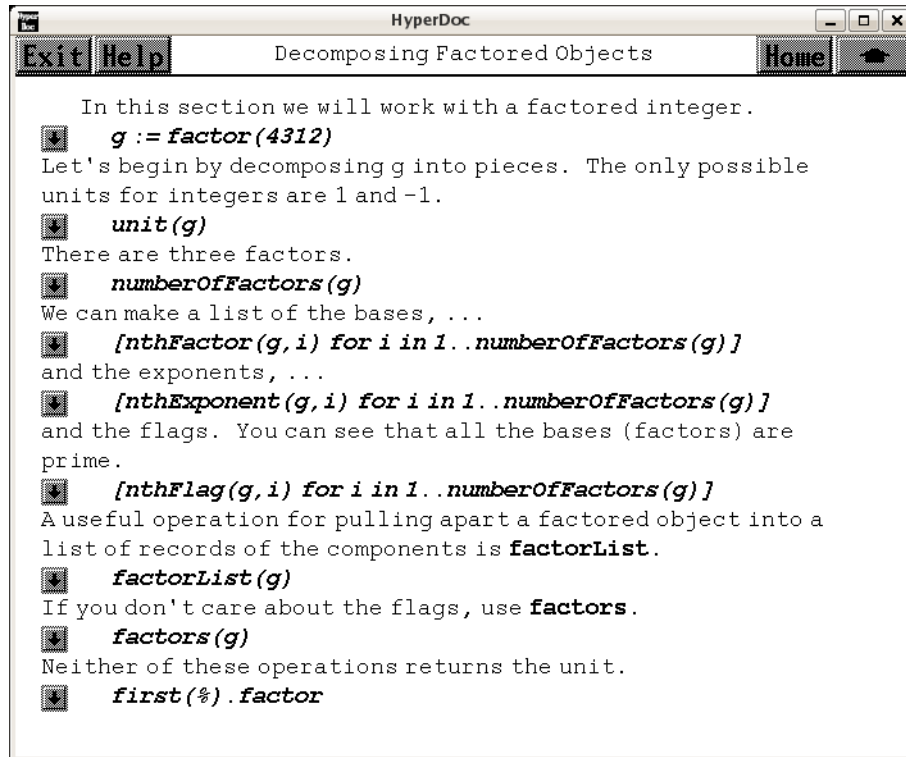

Others, such as addition, require somewhat more work, and the result may not be completely factored unless the argument domain `\spad{R}` provides a `\spadfunFrom{factor}{Factored}` operation.

Each object consists of a unit and a list of factors, where each factor consists of a member of `\spad{R}` (the `{\em base}`), an exponent, and a flag indicating what is known about the base. A flag may be one of `\spad{"nil"}`, `\spad{"sqfr"}`, `\spad{"irred"}` or `\spad{"prime"}`, which mean that nothing is known about the base, it is square-free, it is irreducible, or it is prime, respectively.

The current restriction to factored objects of integral domains allows simplification to be performed without worrying about multiplication order.

3.44 fr2.ht

FactoredFunctions2

⇐ “Creating New Factored Objects” (ugxFactoredNewPage) 3.43 on page 532

⇒ “Factored” (FactoredXmpPage) 3.43 on page 516

⇒ “Computation of Galois Groups” (ugProblemGaloisPage) 12 on page 2306

— fr2.ht —

```

\begin{page}{FactoredFnsTwoXmpPage}{FactoredFunctions2}
\beginscroll

```

```

The \spadtype{FactoredFunctions2} package implements one operation,
\spadfunFrom{map}{FactoredFunctions2}, for applying an operation to every
base in a factored object and to the unit.
\xtc{
}{
\spadpaste{double(x) == x + x \bound{double}}

```

```

}
\xtc{
}{
\spadpaste{f := factor(720) \bound{f}}
}
\xtc{

Actually, the \spadfunFrom{map}{FactoredFunctions2} operation used in this example comes from \spadtype{Factored} itself, since \userfun{double} takes an integer argument and returns an integer result.

}{
\spadpaste{map(double,f) \free{f}\free{double}}
}
\xtc{

If we want to use an operation that returns an object that has a type different from the operation's argument, the \spadfunFrom{map}{FactoredFunctions2} in \spadtype{Factored} cannot be used and we use the one in \spadtype{FactoredFunctions2}.

}{
\spadpaste{makePoly(b) == x + b \bound{makePoly}}
}
\xtc{

In fact, the ‘2’ in the name of the package means that we might be using factored objects of two different types.

}{
\spadpaste{g := map(makePoly,f) \free{f}\free{makePoly}\bound{g}}
}

It is important to note that both versions of \spadfunFrom{map}{FactoredFunctions2} destroy any information known about the bases (the fact that they are prime, for instance).

\xtc{

The flags for each base are set to ‘nil’ in the object returned by \spadfunFrom{map}{FactoredFunctions2}.

}{
\spadpaste{nthFlag(g,1) \free{g}}
}

```

For more information about factored objects and their use, see `\downlink{‘Factored’}{FactoredXmpPage}\ignore{Factored}` and `\downlink{‘Computation of Galois Groups’}{ugProblemGaloisPage}` in Section 8.13`\ignore{ugProblemGalois}`.

3.45 frac.ht

Fraction

⇒ “Integer” (IntegerXmpPage) [3.55](#) on page 696
 ⇒ “notitle” (ContinuedFractionXmpPage) [3.17](#) on page 262
 ⇒ “notitle” (PartialFractionXmpPage) [3.86](#) on page 1088
 — **frac.ht** —

```
\begin{page}{FractionXmpPage}{Fraction}
\beginscroll
```

The `\spadtype{Fraction}` domain implements quotients.
 The elements must belong to a domain of category `\spadtype{IntegralDomain}`:
 multiplication must be commutative and the product of two non-zero
 elements must not be zero.
 This allows you to make fractions of most things you would think of,
 but don't expect to create a fraction of two matrices!
 The abbreviation for `\spadtype{Fraction}` is `\spadtype{FRAC}`.

```
\xctc{
Use \spadopFrom{/}{Fraction} to create a fraction.
}{
\spadpaste{a := 11/12 \bound{a}}
}
\xctc{
}{
\spadpaste{b := 23/24 \bound{b}}
}
\xctc{
The standard arithmetic operations are available.
}{
\spadpaste{3 - a*b**2 + a + b/a \free{a}\free{b}}
}
\xctc{
Extract the numerator and denominator by using
\spadfunFrom{numer}{Fraction} and \spadfunFrom{denom}{Fraction},
respectively.
}{
\spadpaste{numer(a) \free{a}}
}
\xctc{
}{
\spadpaste{denom(b) \free{b}}
}
Operations like \spadfunFrom{max}{Fraction}, \spadfunFrom{min}{Fraction},
\spadfunFrom{negative?}{Fraction}, \spadfunFrom{positive?}{Fraction} and
\spadfunFrom{zero?}{Fraction} are all available if they are provided for
```

the numerators and denominators.

See `\downlink{'Integer'}{IntegerXmpPage}\ignore{Integer}` for examples.

Don't expect a useful answer from `\spadfunFrom{factor}{Fraction}`, `\spadfunFrom{gcd}{Fraction}` or `\spadfunFrom{lcm}{Fraction}` if you apply them to fractions.

```
\xtc{
}{
```

```
\spadpaste{r := (x**2 + 2*x + 1)/(x**2 - 2*x + 1) \bound{r}}
}
```

```
\xtc{
```

Since all non-zero fractions are invertible, these operations have trivial definitions.

```
}{
```

```
\spadpaste{factor(r) \free{r}}
}
```

```
\xtc{
```

Use `\spadfunFrom{map}{Fraction}` to apply `\spadfunFrom{factor}{Fraction}` to the numerator and denominator, which is probably what you mean.

```
}{
```

```
\spadpaste{map(factor,r) \free{r}}
}
```

```
\xtc{
```

Other forms of fractions are available.

Use `\spadfun{continuedFraction}` to create a continued fraction.

```
}{
```

```
\spadpaste{continuedFraction(7/12)}
}
```

```
\xtc{
```

Use `\spadfun{partialFraction}` to create a partial fraction.

See `\downlink{'ContinuedFraction'}{ContinuedFractionXmpPage}`

`\ignore{ContinuedFraction}` and

`\downlink{'PartialFraction'}{PartialFractionXmpPage}`

`\ignore{PartialFraction}` for

additional information and examples.

```
}{
```

```
\spadpaste{partialFraction(7,12)}
}
```

```
\xtc{
```

Use conversion to create alternative views of fractions with objects moved in and out of the numerator and denominator.

```
}{
```

```
\spadpaste{g := 2/3 + 4/5*%i \bound{g}}
}
```

```
\xtc{
```

Conversion is discussed in detail in

`\downlink{'Conversion'}{ugTypesConvertPage}`

in Section 2.7`\ignore{ugTypesConvert}`.

```

FullPartialFracExpansion

⇒ “notitle” (PartialFractionXmpPage) [3.86](#) on page [1088](#)

— fparfrac.ht —

```

\begin{page}{FullPartialFracExpansionXmpPage}{FullPartialFracExpansion}
\begin{scroll}

```

The domain \spadtype{FullPartialFracExpansion} implements
factor-free conversion of quotients to full partial fractions.

```

\xtc{
Our examples will all involve quotients of univariate polynomials
with rational number coefficients.
}{
\spadpaste{Fx := FRAC UP(x, FRAC INT) \bound{Fx}}

```

```

}
\xtc{
Here is a simple-looking rational function.
}{
\spadpaste{f : Fx := 36 / (x**5-2*x**4-2*x**3+4*x**2+x-2) \bound{f}\free{Fx}}
}
\xtc{
We use \spadfunFrom{fullPartialFraction}{FullPartialFracExpansion}
to convert it to an object of type
\spadtype{FullPartialFracExpansion}.
}{
\spadpaste{g := fullPartialFraction f \bound{g}\free{f}}
}
\xtc{
Use a coercion to change it back into a quotient.
}{
\spadpaste{g :: Fx \free{g}}
}
\xtc{
Full partial fractions differentiate faster than rational
functions.
}{
\spadpaste{g5 := D(g, 5) \free{g}\bound{g5}}
}
\xtc{
}{
\spadpaste{f5 := D(f, 5) \free{f}\bound{f5}}
}
\xtc{
We can check that the two forms represent the same function.
}{
\spadpaste{g5::Fx - f5 \free{Fx g5 f5}}
}
\xtc{
Here are some examples that are more complicated.
}{
\spadpaste{f : Fx := (x**5 * (x-1)) / ((x**2 + x + 1)**2 * (x-2)**3)
\free{Fx}\bound{f2}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f2}\bound{g2}}
}
\xtc{
}{
\spadpaste{g :: Fx - f \free{f2 g2 Fx}}
}
\xtc{
}{
\spadpaste{f : Fx := (2*x**7-7*x**5+26*x**3+8*x) /

```

```

(x**8-5*x**6+6*x**4+4*x**2-8) \free{Fx}\bound{f3}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f3}\bound{g3}}
}
\xtc{
}{
\spadpaste{g :: Fx - f \free{f3} g3 Fx}}
}
\xtc{
}{
\spadpaste{f:Fx := x**3 /
(x**21 + 2*x**20 + 4*x**19 + 7*x**18 + 10*x**17 + 17*x**16 +
22*x**15 + 30*x**14 + 36*x**13 + 40*x**12 + 47*x**11 + 46*x**10 +
49*x**9 + 43*x**8 + 38*x**7 + 32*x**6 + 23*x**5 + 19*x**4 +
10*x**3 + 7*x**2 + 2*x + 1)\free{Fx}\bound{f4}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f4}\bound{g4}}
}
\xtc{
This verification takes much longer than the conversion to
partial fractions.
}{
\spadpaste{g :: Fx - f \free{f4} g4 Fx}}
}

```

Algebraic Functions

— function.ht —

```

\begin{page}{AlgebraicFunctionPage}{Algebraic Functions}
\beginscroll
Algebraic functions are functions defined by algebraic equations. There
are two ways of constructing them: using rational powers, or implicitly.
For rational powers, use \spadopFrom{**}{RadicalCategory}
(or the system functions \spadfun{sqrt} and
\spadfun{nthRoot} for square and nth roots):
\spadpaste{f := sqrt(1 + x ** (1/3))\bound{f}}
To define an algebraic function implicitly
use \spadfun{rootOf}. The following
line defines a function \spad{y} of \spad{x} satisfying the equation
\spad{y**3 = x*y - y**2 - x**3 + 1}:
\spadpaste{y := rootOf(y**3 + y**2 - x*y + x**3 - 1, y)\bound{y}}
You can manipulate, differentiate or integrate an implicitly defined
algebraic function like any other Axiom function:
\spadpaste{differentiate(y, x)\free{y}}
Higher powers of algebraic functions are automatically reduced during
calculations:
\spadpaste{(y + 1) ** 3\free{y}}
But denominators, are not automatically rationalized:
\spadpaste{g := inv f\bound{g}\free{y}}
Use \spadfun{ratDenom} to remove the algebraic quantities
from the denominator:
\spadpaste{ratDenom g\free{g}}

Elementary Functions

— function.ht —

```

\begin{page}{ElementaryFunctionPage}{Elementary Functions}
\begin{scroll}
Axiom has most of the usual functions from calculus built-in:
\spadpaste{f := x * log y * sin(1/(x+y))\bound{f}}
You can substitute values or another elementary functions for
the variables with the function \spadfun{eval}:
\spadpaste{eval(f, [x = y, y = x])\free{f}}
As you can see, the substitutions are made 'in parallel' as in the
case of polynomials. It's also possible to substitute expressions
for kernels instead of variables:
\spadpaste{eval(f, log y = acosh(x + sqrt y))\free{f}}
\end{scroll}
\autobuttons

```

Simplification

⇒ “notitle” (ugUserRulesPage) 10 on page 1949
— **function.ht** —

```

\begin{page}{FunctionSimplificationPage}{Simplification}
\begin{scroll}
Simplifying an expression often means different things at
different times, so Axiom offers a large number of
'simplification' functions.
The most common one, which performs the usual trigonometric
simplifications is \spadfun{simplify}:
\spadpaste{f := cos(x)/sec(x) * log(sin(x)**2/(cos(x)**2+sin(x)**2))
\bound{f}}
\spadpaste{g := simplify f\bound{g}\free{f}}
If the result of \spadfun{simplify} is not satisfactory, specific
transformations are available.
For example, to rewrite \spad{g} in terms of secants and
cosecants instead of sines and cosines, issue:
%
\spadpaste{h := sin2csc cos2sec g\bound{h}\free{g}}

```

```

%
To apply the logarithm simplification rules to \spad{h}, issue:
\spadpaste{expandLog h\free{h}}
Since the square root of \spad{x**2} is the absolute value of
\spad{x} and not \spad{x} itself, algebraic radicals are not
automatically simplified, but you can specifically request it by
calling \spadfun{rootSimp}:
%
\spadpaste{f1 := sqrt((x+1)**3)\bound{f1}}
\spadpaste{rootSimp f1\free{f1}}
%
There are other transformations which are sometimes useful.
Use the functions \spadfun{complexElementary} and \spadfun{trigs}
to go back and forth between the complex exponential and
trigonometric forms of an elementary function:
%
\spadpaste{g1 := sin(x + cos x)\bound{g1}}
\spadpaste{g2 := complexElementary g1\bound{g2}\free{g1}}
\spadpaste{trigs g2\free{g2}}
%
Similarly, the functions \spadfun{realElementary} and
\spadfun{htrigs} convert hyperbolic functions in and out of their
exponential form:
%
\spadpaste{h1 := sinh(x + cosh x)\bound{h1}}
\spadpaste{h2 := realElementary h1\bound{h2}\free{h1}}
\spadpaste{htrigs h2\free{h2}}
%
Axiom has other transformations, most of which
are in the packages
\spadtype{ElementaryFunctionStructurePackage},
\spadtype{TrigonometricManipulations},
\spadtype{AlgebraicManipulations},
and \spadtype{TranscendentalManipulations}.
If you need to apply a simplification rule not built into the
system, you can use Axiom's \downlink{pattern
matcher}{ugUserRulesPage}.
\endscroll

```
\begin{page}{GroebnerFactorizationPkgXmpPage}
{GroebnerFactorizationPkg}
\beginscroll
%% J. Grabmeier 26 04 91
Solving systems of polynomial equations with the
\texht{Gr\{"o}bner}{Groebner}
basis algorithm can often be very time consuming because, in general,
the algorithm has exponential run-time.
These systems, which often come from concrete applications,
frequently have symmetries which are not taken advantage of by the
algorithm.
However, it often happens in this case
that the polynomials which occur during the
\texht{Gr\{"o}bner}{Groebner} calculations are reducible.
Since Axiom has an excellent polynomial factorization algorithm, it is
very natural to combine the
\texht{Gr\{"o}bner}{Groebner} and factorization algorithms.

\spadtype{GroebnerFactorizationPkg} exports the
\axiomFunFrom{groebnerFactorize}{GroebnerFactorizationPkg}
operation which implements a modified
\texht{Gr\{"o}bner}{Groebner} basis algorithm.
In this algorithm, each polynomial that is to be put into the
partial list of the basis is first factored.
The remaining calculation is split into as many parts as there are
irreducible factors.
Call these factors \texht{$p_1, \ldots, p_n.$}{\spad{p1, ..., pn.}}
In the branches corresponding to \texht{$p_2,
\ldots, p_n,$}{\spad{p2, ..., pn,}} the factor
\texht{$p_1$}{\spad{p1}} can be divided out, and so on.
This package also contains operations that allow you to specify the
polynomials that are not zero on the common roots of the final
\texht{Gr\{"o}bner}{Groebner} basis.

Here is an example from chemistry.
In a theoretical model of the cyclohexan
\texht{$\{\rm C\}_6\{\rm H\}_{12}$}{C6H12},
the six carbon atoms each sit in the center of gravity of a
tetrahedron that has two hydrogen atoms and two carbon atoms at its
corners.
We first normalize and set the length of each edge to 1.
Hence, the distances of one fixed carbon atom to each of its
```

immediate neighbours is 1.

We will denote the distances to the other three carbon atoms by x , y and z .

%% reference?

$\text{\texht{A.~Dress}}$ {A. Dress} developed a theory to decide whether a set of points and distances between them can be realized in an n -dimensional space. Here, of course, we have $\mathit{n} = 3$.

$\text{\xtc{}}$

{

$\text{\spadpaste{mfzn : SQMATRIX(6,DMP([x,y,z],Fraction INT)) :=$
 $[[0,1,1,1,1], [1,0,1,8/3,x,8/3], [1,1,0,1,8/3,y], [1,8/3,1,0,1,8/3],$
 $[1,x,8/3,1,0,1], [1,8/3,y,8/3,1,0]] \text{\bound{mfzn}}}$

}

$\text{\xtc{}}$

For the cyclohexan, the distances have to satisfy this equation.

{

$\text{\spadpaste{eq := determinant mfzn \free{mfzn}\bound{eq}}}$

}

$\text{\xtc{}}$

They also must satisfy the equations

given by cyclic shifts of the indeterminates.

{

$\text{\spadpaste{groebnerFactorize [eq, eval(eq, [x,y,z], [y,z,x]),$
 $eval(eq, [x,y,z], [z,x,y])]\text{\free{eq}}}$

}

The union of the solutions of this list is the solution of our original problem.

If we impose positivity conditions, we get two relevant ideals.

One ideal is

zero-dimensional, namely $\mathit{x} = \mathit{y} = \mathit{z} = 11/3$, and this determines the ‘‘boat’’ form of the cyclohexan.

The other ideal is one-dimensional,

which means that we have a solution space given by one parameter.

This gives the ‘‘chair’’ form of the cyclohexan.

The parameter describes the angle of the ‘‘back of the chair.’’

$\text{\axiomFunFrom{groebnerFactorize}\{GroebnerFactorizationPkg\}}$

has an optional $\text{\axiomType{Boolean}}$ -valued second argument.

When it is $\text{\spad{true}}$ partial results are displayed,

since it may happen that the

calculation does not terminate in a reasonable time.

See the source code for $\text{\spadtype{GroebnerFactorizationPkg}}$

in $\{\text{\bf groebf}\text{\spadFileExt}\}$ for more details about the algorithms used.

```
\begin{page}{GlossaryPage}{G l o s s a r y}
```

```
\begin{scroll}\begin{item}\newline{\em \menuitemstyle{}}{\em !}\space{}
```

```
{\em (syntax)} Suffix character for \spadgloss{destructive operations}.
```

```
\item\newline{\em \menuitemstyle{}}{\em ,}\space{}
```

{\em (syntax)} a separator for items in a \spadgloss{tuple},{}

\spadignore{e.g.} to separate arguments of a function \spad{f(x,{y})}.

\item\newline{\em \menuitemstyle{}}{\em =>}\space{}

{\em (syntax)} the expression \spad{a => b} is equivalent to

\spad{if a then} \spadgloss{exit} \spad{b}.

\item\newline{\em \menuitemstyle{}}{\em ?}\space{}

1. {\em (syntax)} a suffix character for Boolean-valued \spadfun{function} names,{}

\spadignore{e.g.} \spadfun{odd?}. 2. Suffix character for pattern variables. 3. The special type \spad{?} means {\em don't care}. For example,{}

\newline\center{\spad{x : Polynomial ?}}\newline,{}

means that values assigned to \spad{x} must be polynomials over an arbitrary \spadgloss{underlying domain}.

\item\newline{\em \menuitemstyle{}}{\em abstract datatype}\space{}

a programming language principle used in Axiom where a datatype is defined in two parts: (1) a {\em public} part describing a set of \spadgloss{exports},{}

principally operations that apply to objects of that type,{}

and (2) a {\em private} part describing the implementation of the datatype usually in terms of a \spadgloss{representation} for objects of the type. Programs which create and otherwise manipulate objects of the type may only do so through its exports. The representation and other implementation information is specifically hidden.

\item\newline{\em \menuitemstyle{}}{\em abstraction}\space{}

described functionally or conceptually without regard to implementation

\item\newline{\em \menuitemstyle{}}{\em accuracy}\space{}

the degree of exactness of an approximation or measurement. In computer algebra systems,{}

computations are typically carried out with complete accuracy using integers or rational numbers of indefinite size. Domain \spadtype{Float} provides a function \spadfunFrom{precision}{Float} to change the precision for floating point computations. Computations using \spadtype{DoubleFloat} have a fixed precision but uncertain accuracy.

\item\newline{\em \menuitemstyle{}}{\em add-chain}\space{}

a hierarchy formed by \spadgloss{domain extensions}. If domain \spad{A} extends domain \spad{B} and domain \spad{B} extends domain \spad{C},{}

then \spad{A} has {\em add-chain} \spad{B}-\spad{C}.

\item\newline{\em \menuitemstyle{}}{\em aggregate}\space{}

a data structure designed to hold multiple values. Examples of aggregates are \spadtype{List},{}

\spadtype{Set},{}

\spadtype{Matrix} and \spadtype{Bits}.

\item\newline{\em \menuitemstyle{}}{\em AKCL}\space{}

Austin Kyoto Common LISP,{}

a version of \spadgloss{\spad{KCL}} produced by William Schelter,{}

Austin,{}

Texas.

\item\newline{\em \menuitemstyle{}}{\em algorithm}\space{}

a step-by-step procedure for a solution of a problem; a program

\item\newline{\em \menuitemstyle{}}{\em ancestor}\space{}

(of a domain) a category which is a \spadgloss{parent} of the domain,{}

or a \spadgloss{parent} of a \spadgloss{parent},{}

and so on.

\item\newline{\em \menuitemstyle{}}{\em application}\space{}

{\em (syntax)} an expression denoting "application" of a function to a set of \spadgloss{argument} parameters. Applications are written as a \spadgloss{parameterized form}. For example,{}

\spad{f(x,{y})}

indicates the "application of the function \spad{f} to the tuple of

arguments `\spad{x}` and `\spad{y}`". See also `\spadgloss{evaluation}` and `\spadgloss{invocation}`.

`\item\newline{\em \menuitemstyle{}}{\em apply}\space{}`

See `\spadgloss{application}`.

`\item\newline{\em \menuitemstyle{}}{\em argument}\space{}`

1. (actual argument) a value passed to a function at the time of a `\spadglossSee{function call}{application}`; also called an `{\em actual parameter}`. 2. (formal argument) a variable used in the definition of a function to denote the actual argument passed when the function is called.

`\item\newline{\em \menuitemstyle{}}{\em arity}\space{}`

1. (function) the number of arguments. 2. (operator or operation) corresponds to the arity of a function implementing the operator or operation.

`\item\newline{\em \menuitemstyle{}}{\em assignment}\space{}`

`{\em (syntax)}` an expression of the form `\spad{x := e}`, `{}` meaning "assign the value of `\spad{e}` to `\spad{x}`". After `\spadgloss{evaluation}`, `{}` the `\spadgloss{variable}` `\spad{x}` `\spadglossSee{points}{pointer}` to an object obtained by evaluating the expression `\spad{e}`. If `\spad{x}` has a `\spadgloss{type}` as a result of a previous `\spadgloss{declaration}`, `{}` the object assigned to `\spad{x}` must have that type. An interpreter must often `\spadglossSee{coerce}{coercion}` the value of `\spad{e}` to make that happen. For example, `{}` in the interpreter, `{}` `\center{\spad{x : Float := 11}}` first `\spadglossSee{declares}{declaration}` `\spad{x}` to be a float. This declaration causes the interpreter to coerce 11 to 11.0 in order to assign a floating point value to `\spad{x}`.

`\item\newline{\em \menuitemstyle{}}{\em attribute}\space{}`

a name or functional form denoting `{\em any}` useful computational property. For example, `{}` `\spadatt{commutative(\spad{"*"})}` asserts that "`\spadfun{*}` is commutative". Also, `{}` `\spadatt{finiteAggregate}` is used to assert that an aggregate has a finite number of immediate components.

`\item\newline{\em \menuitemstyle{}}{\em basis}\space{}`

`{\em (algebra)}` `\spad{S}` is a basis of a module `\spad{M}` over a `\spadgloss{ring}` if `\spad{S}` generates `\spad{M}`, `{}` and `\spad{S}` is linearly independent

`\item\newline{\em \menuitemstyle{}}{\em benefactor}\space{}`

(of a given domain) a domain or package that the given domain explicitly references (for example, `{}` calls functions from) in its implementation

`\item\newline{\em \menuitemstyle{}}{\em binary}\space{}`

operation or function with `\spadgloss{arity}` 2

`\item\newline{\em \menuitemstyle{}}{\em binding}\space{}`

the association of a variable with properties such as `\spadgloss{value}` and `\spadgloss{type}`. The top-level `\spadgloss{environment}` in the interpreter consists of bindings for all user variables and functions. Every `\spadgloss{function}` has an associated set of bindings, `{}` one for each formal `\spadgloss{argument}` and `\spadgloss{local variable}`.

`\item\newline{\em \menuitemstyle{}}{\em block}\space{}`

`{\em (syntax)}` a control structure where expressions are sequentially `\spadglossSee{evaluated}{evaluation}`.

`\item\newline{\em \menuitemstyle{}}{\em body}\space{}`

a `\spadgloss{function body}` or `\spadgloss{loop body}`.

`\item\newline{\em \menuitemstyle{}}{\em boolean}\space{}`

objects denoted by the `\spadgloss{literals}` `\spad{true}` and `\spad{false}`; elements of domain `\spadtype{Boolean}`. See also `\spadtype{Bits}`.

`\item\newline\em \menuitemstyle{}\{\em built-in function}\space{}`
a `\spadgloss{function}` in the standard Axiom library. Contrast `\spadgloss{user function}`.

`\item\newline\em \menuitemstyle{}\{\em cache}\space{}`
1. (noun) a mechanism for immediate retrieval of previously computed data. For example, `{}` a function which does a lengthy computation might store its values in a `\spadgloss{hash table}` using argument as a key. The hash table then serves as a cache for the function (see also `\spadsyscom{set function cache}`). Also, `{}` when `\spadgloss{recurrence relations}` which depend upon `\spad{n}` previous values are compiled, `{}` the previous `\spad{n}` values are normally cached (use `\spadsyscom{set functions recurrence}` to change this).
2. (verb) to save values in a cache.

`\item\newline\em \menuitemstyle{}\{\em capsule}\space{}`
the part of the `\spadglossSee{body}{function body}` of a `\spadgloss{domain constructor}` that defines the functions implemented by the constructor.

`\item\newline\em \menuitemstyle{}\{\em case}\space{}`
`{\em (syntax)}` an operator used to conditionally evaluate code based on the branch of a `\spadgloss{Union}`. For example, `{}` if value `\spad{u}` is `\spad{Union(Integer, {"failed"})}`, `{}` the conditional expression `\spad{if u case Integer then A else B}` evaluate `\spad{A}` if `\spad{u}` is an integer and `\spad{B}` otherwise.

`\item\newline\em \menuitemstyle{}\{\em Category}\space{}`
the distinguished object denoting the type of a category; the class of all categories.

`\item\newline\em \menuitemstyle{}\{\em category}\space{}`
`{\em (basic concept)}` second-order types which serve to define useful "classification worlds" for domains, `{}` such as algebraic constructs (`\spadignore{e.g.}` groups, `{}` rings, `{}` fields), `{}` and data structures (`\spadignore{e.g.}` homogeneous aggregates, `{}` collections, `{}` dictionaries). Examples of categories are `\spadtype{Ring}` ("the class of all rings") and `\spadtype{Aggregate}` ("the class of all aggregates"). The categories of a given world are arranged in a hierarchy (formally, `{}` a directed acyclic graph). Each category inherits the properties of all its ancestors. Thus, `{}` for example, `{}` the category of ordered rings (`\spadtype{OrderedRing}`) inherits the properties of the category of rings (`\spadtype{Ring}`) and those of the ordered sets (`\spadtype{OrderedSet}`). Categories provide a database of algebraic knowledge and ensure mathematical correctness, `{}` `\spadignore{e.g.}` that "matrices of polynomials" is correct but "polynomials of hash tables" is not, `{}` that the multiply operation for "polynomials of continued fractions" is commutative, `{}` but that for "matrices of power series" is not. optionally provide "default definitions" for operations they export. Categories are defined in Axiom by functions called `\spadgloss{category constructors}`. Technically, `{}` a category designates a class of domains with common `\spadgloss{operations}` and `\spadgloss{attributes}` but usually with different `\spadgloss{functions}` and `\spadgloss{representations}` for its constituent `\spadgloss{objects}`. Categories are always defined using the Axiom library language

(see also \spadgloss{category extension}). See also file {\em catdef.spad} for definitions of basic algebraic categories in Axiom.

\item\newline{\em \menuitemstyle{}}{\em category constructor}\space{} a function that creates categories,{} described by an abstract datatype in the Axiom programming language. For example,{} the category constructor \spadtype{Module} is a function which takes a domain parameter \spad{R} and creates the category "modules over \spad{R}".

\item\newline{\em \menuitemstyle{}}{\em category extension}\space{} created by a category definition,{} an expression usually of the form \spad{A == B with ...}. In English,{} this means "category A is a \spad{B} with the new operations and attributes as given by ...". See,{} for example,{} file {\em catdef.spad} for a definitions of the algebra categories in Axiom,{} {\em aggcat.spad} for data structure categories.

\item\newline{\em \menuitemstyle{}}{\em category hierarchy}\space{} hierarchy formed by category extensions. The root category is \spadtype{Object}. A category can be defined as a \spadgloss{Join} of two or more categories so as to have multiple \spadgloss{parents}. Categories may also have parameterized so as to allow conditional inheritance.

\item\newline{\em \menuitemstyle{}}{\em character}\space{} 1. an element of a character set,{} as represented by a keyboard key. 2. a component of a string. For example,{} the 0th element of the string \spad{"hello there"} is the character {\em h}.

\item\newline{\em \menuitemstyle{}}{\em client}\space{} (of a given domain) any domain or package that explicitly calls functions from the given domain

\item\newline{\em \menuitemstyle{}}{\em coercion}\space{} an automatic transformation of an object of one \spadgloss{type} to an object of a similar or desired target type. In the interpreter,{} coercions and \spadgloss{retractions} are done automatically by the interpreter when a type mismatch occurs. Compare \spadgloss{conversion}.

\item\newline{\em \menuitemstyle{}}{\em comment}\space{} textual remarks imbedded in code. Comments are preceded by a double dash ({\em --}). For Axiom library code,{} stylized comments for on-line documentation are preceded by a two plus signs ({\em ++}).

\item\newline{\em \menuitemstyle{}}{\em Common LISP}\space{} A version of \spadgloss{LISP} adopted as an informal standard by major users and suppliers of LISP

\item\newline{\em \menuitemstyle{}}{\em compile-time}\space{} the time when category or domain constructors are compiled. Contrast \spadgloss{run-time}.

\item\newline{\em \menuitemstyle{}}{\em compiler}\space{} a program that generates low-level code from a higher-level source language. Axiom has three compilers. A {\em graphics compiler} converts graphical formulas to a compiled subroutine so that points can be rapidly produced for graphics commands. An {\em interpreter compiler} optionally compiles \spadgloss{user functions} when first \spadglossSee{invoked}{invocation} (use \spadsyscom{set functions compile} to turn this feature on). A {\em library compiler} compiles all constructors (not available in Release 1)

\item\newline{\em \menuitemstyle{}}{\em computational object}\space{}

In Axiom, {} domains are objects. This term is used to distinguish the objects which are members of domains rather than domains themselves.

\item\newline{\em \menuitemstyle{}}{\em conditional}\space{} a \spadgloss{control structure} of the form \spad{if A then B else C}; The \spadgloss{evaluation} of \spad{A} produces \spad{true} or \spad{false}. If \spad{true}, {} \spad{B} evaluates to produce a value; otherwise \spad{C} evaluates to produce a value. When the value is not used, {} \spad{else C} part can be omitted.

\item\newline{\em \menuitemstyle{}}{\em constant}\space{} {\em (syntax)} a reserved word used in \spadgloss{signatures} in Axiom programming language to signify that mark an operation always returns the same value. For example, {} the signature \spad{0: constant -> \\$} in the source code of \spadtype{AbelianMonoid} tells the Axiom compiler that \spad{0} is a constant so that suitable optimizations might be performed.

\item\newline{\em \menuitemstyle{}}{\em constructor}\space{} a \spadgloss{function} which creates a \spadgloss{category}, {} \spadgloss{domain}, {} or \spadgloss{package}.

\item\newline{\em \menuitemstyle{}}{\em continuation}\space{} when a line of a program is so long that it must be broken into several lines, {} then all but the first line are called {\em continuation lines}. If such a line is given interactively, {} then each incomplete line must end with an underscore.

\item\newline{\em \menuitemstyle{}}{\em control structure}\space{} program structures which can specify a departure from normal sequential execution. Axiom has four kinds of control structures: \spadgloss{blocks}, {} \spadgloss{case} statements, {} \spadgloss{conditionals}, {} and \spadgloss{loops}.

\item\newline{\em \menuitemstyle{}}{\em conversion}\space{} the transformation of an object on one \spadgloss{type} to one of another type. Conversions performed automatically are called \spadgloss{coercions}. These happen when the interpreter has a type mismatch and a similar or declared target type is needed. In general, {} the user must use the infix operation \spadSyntax{\spad{::}} to cause this transformation.

\item\newline{\em \menuitemstyle{}}{\em copying semantics}\space{} the programming language semantics used in Pascal but {\em not} in Axiom. See also \spadgloss{pointer semantics} for details.

\item\newline{\em \menuitemstyle{}}{\em data structure}\space{} a structure for storing data in the computer. Examples are \spadgloss{lists} and \spadgloss{hash tables}.

\item\newline{\em \menuitemstyle{}}{\em datatype}\space{} equivalent to \spadgloss{domain} in Axiom.

\item\newline{\em \menuitemstyle{}}{\em declaration}\space{} {\em (syntax)} an expression of the form \spad{x : T} where \spad{T} is some \spad{type}. A declaration forces all values \spadglossSee{assigned}{assignment} to \spad{T} to be of that type. If a value is of a different type, {} the interpreter will try to \spadglossSee{coerce}{coercion} the value to type \spad{T}. Declarations are necessary in case of ambiguity or when a user wants to introduce an \spadglossSee{unexposed}{expose} domain.

\item\newline{\em \menuitemstyle{}}{\em default definition}\space{} {}

a function defined by a `\spadgloss{category}`. Such definitions appear category definitions of the form `\spad{C: Category == T add I}` in an optional implementation part `\spad{I}` to the right of the keyword `\spad{add}`.

`\item\newline{\em \menuitemstyle{}}{\em default package}\space{}`
 a optional `\spadgloss{package}` of `\spadgloss{functions}` associated with a category. Such functions are necessarily defined in terms over other functions exported by the category.

`\item\newline{\em \menuitemstyle{}}{\em definition}\space{}`
`{\em (syntax)}` 1. An expression of the form `\spad{f(a) == b}` defining function `\spad{f}` with `\spadgloss{formal arguments}` `\spad{a}` and `\spadgloss{body}` `\spad{b}`; equivalent to the statement `\spad{f == (a) +-> b}`. 2. An expression of the form `\spad{a == b}` where `\spad{a}` is a `\spadgloss{symbol}`, `{}` equivalent to `\spad{a()} == b`. See also `\spadgloss{macro}` where a similar substitution is done at `\spadgloss{parse}` time.

`\item\newline{\em \menuitemstyle{}}{\em delimiter}\space{}`
 a `\spadgloss{character}` which marks the beginning or end of some syntactically correct unit in the language, `{}` `\spadignore{e.g.}` `\spadSyntax{"}` for strings, `{}` blanks for identifiers.

`\item\newline{\em \menuitemstyle{}}{\em destructive operation}\space{}`
 An operation which changes a component or structure of a value. In Axiom, `{}` all destructive operations have names which end with an exclamation mark (`{\em !}`). For example, `{}` domain `\spadtype{List}` has two operations to reverse the elements of a list, `{}` one named `\spadfunFrom{reverse}{List}` which returns a copy of the original list with the elements reversed, `{}` another named `\spadfunFrom{reverse!}{List}` which reverses the elements `{\em in place}` thus destructively changing the original list.

`\item\newline{\em \menuitemstyle{}}{\em documentation}\space{}`
 1. on-line or hard copy descriptions of Axiom; 2. text in library code preceded by `{\em ++}` comments as opposed to general comments preceded by `{\em --}`.

`\item\newline{\em \menuitemstyle{}}{\em domain}\space{}`
`{\em (basic concept)}` a domain corresponds to the usual notion of abstract datatypes: that of a set of values and a set of "exported operations" for the creation and manipulation of these values. Datatypes are parameterized, `{}` dynamically constructed, `{}` and can combine with others in any meaningful way, `{}` `\spadignore{e.g.}` "lists of floats" (`\spadtype{List Float}`), `{}` "fractions of polynomials with integer coefficients" (`\spadtype{Fraction Polynomial Integer}`), `{}` "matrices of infinite `\spadgloss{streams}` of cardinal numbers" (`\spadtype{Matrix Stream CardinalNumber}`). The term `{\em domain}` is actually abbreviates `{\em domain of computation}`. Technically, `{}` a domain denotes a class of objects, `{}` a class of `\spadgloss{operations}` for creating and other manipulating these objects, `{}` and a class of `\spadgloss{attributes}` describing computationally useful properties. Domains also provide `\spadgloss{functions}` for each operation often in terms of some `\spadgloss{representation}` for the objects. A domain itself is an `\spadgloss{object}` created by a `\spadgloss{function}` called a `\spadgloss{domain constructor}`.

\item\newline{\em \menuitemstyle{}}{\em domain constructor}\space{}
a function that creates domains,{} described by an abstract datatype
in the Axiom programming language. Simple domains like
\spadtype{Integer} and \spadtype{Boolean} are created by domain
constructors with no arguments. Most domain constructors take one or
more parameters,{} one usually denoting an \spadgloss{underlying domain}.
For example,{} the domain \spadtype{Matrix(R)} denotes "matrices over
\spad{R}". Domains {\em Mapping},{} {\em Record},{} and {\em Union} are
primitive domains. All other domains are written in the Axiom
programming language and can be modified by users with access to the
library source code.

\item\newline{\em \menuitemstyle{}}{\em domain extension}\space{}
a domain constructor \spad{A} is said to {\em extend} a domain
constructor \spad{B} if \spad{A}\spad{s} definition has the form
\spad{A} == B add ...}. This intuitively means "functions not defined
by \spad{A} are assumed to come from \spad{B}". Successive domain
extensions form \spadgloss{add-chains} affecting the the
\spadglossSee{search order}{lineage} for functions not implemented
directly by the domain during \spadgloss{dynamic lookup}.

\item\newline{\em \menuitemstyle{}}{\em dot notation}\space{}
using an infix dot ({\em .}) for function application. If \spad{u} is
the list \spad{[7,{}4,{}-11]} then both \spad{u(2)} and \spad{u.2} return
4. Dot notation nests to left. Thus \spad{f . g . h} is equivalent to
\spad{(f . g) . h}.

\item\newline{\em \menuitemstyle{}}{\em dynamic}\space{}
that which is done at \spadgloss{run-time} as opposed to
\spadgloss{compile-time}. For example,{} the interpreter will build the
domain "matrices over integers" dynamically in response to user input.
However,{} the compilation of all functions for matrices and integers is
done during \spadgloss{compile-time}. Contrast \spadgloss{static}.

\item\newline{\em \menuitemstyle{}}{\em dynamic lookup}\space{}
In Axiom,{} a \spadgloss{domain} may or may not explicitly provide
\spadgloss{function} definitions for all of its exported
\spadgloss{operations}. These definitions may instead come from domains
in the \spadgloss{add-chain} or from \spadgloss{default packages}. When
a \spadglossSee{function call}{application} is made for an operation in
the domain,{} up to five steps are carried out.\begin{items} \item (1)
If the domain itself implements a function for the operation,{} that
function is returned. \item (2) Each of the domains in the
\spadgloss{add-chain} are searched for one which implements the function;
if found,{} the function is returned. \item (3) Each of the
\spadgloss{default packages} for the domain are searched in order of
the \spadgloss{lineage}. If any of the default packages implements the
function,{} the first one found is returned. \item (4) Each of the
\spadgloss{default packages} for each of the domains in the
\spadgloss{add-chain} are searched in the order of their
\spadgloss{lineage}. If any of the default packages implements the
function,{} the first one found is returned. \item (5) If all of the
above steps fail,{} an error message is reported. \end{items}

\item\newline{\em \menuitemstyle{}}{\em empty}\space{}

the unique value of objects with type `\spadtype{Void}`.

`\item\newline{\em \menuitemstyle{}}{\em environment}\space{}`
a set of `\spadgloss{bindings}`.

`\item\newline{\em \menuitemstyle{}}{\em evaluation}\space{}`
a systematic process which transforms an `\spadgloss{expression}` into an object called the `\spadgloss{value}` of the expression. Evaluation may produce `\spadgloss{side effects}`.

`\item\newline{\em \menuitemstyle{}}{\em exit}\space{}`
`{\em (reserved word)}` an `\spadgloss{operator}` which forces an exit from the current block. For example, `{}` the `\spadgloss{block}` `\spad{(a := 1; if i > 0 then exit a; a := 2)}` will prematurely exit at the second statement with value 1 if the value of `\spad{i}` is greater than 0. See `\spadgloss{\spad{=>}}` for an alternate syntax.

`\item\newline{\em \menuitemstyle{}}{\em explicit export}\space{}`
1. (of a domain `\spad{D}`) any `\spadgloss{attribute}`, `{}` `\spadgloss{operation}`, `{}` or `\spadgloss{category}` explicitly mentioned in the `\spadgloss{type}` specification part `\spad{T}` for the domain constructor definition `\spad{D: T == I}` 2. (of a category `\spad{C}`) any `\spadgloss{attribute}`, `{}` `\spadgloss{operation}`, `{}` or `\spadgloss{category}` explicitly mentioned in the `\spadgloss{type}` specification part `\spad{T}` for the domain constructor definition `\spad{C: \spadgloss{Category} == T}`

`\item\newline{\em \menuitemstyle{}}{\em export}\space{}`
`\spadgloss{explicit export}` or `\spadgloss{implicit export}` of a domain or category

`\item\newline{\em \menuitemstyle{}}{\em expose}\space{}`
some constructors are `{\em exposed}`, `{}` others `{\em unexposed}`. Exposed domains and packages are recognized by the interpreter. Use `\spadsys{set expose}` to control change what is exposed. To see both exposed and unexposed constructors, `{}` use `\Browse{}` with give the system command `\spadsyscom{set hyperdoc browse exposure on}`. Unexposed constructors will now appear prefixed by star(`\spad{*}`).

`\item\newline{\em \menuitemstyle{}}{\em expression}\space{}`
1. any syntactically correct program fragment. 2. an element of domain `\spadtype{Expression}`

`\item\newline{\em \menuitemstyle{}}{\em extend}\space{}`
see `\spadgloss{category extension}` or `\spadgloss{domain extension}`

`\item\newline{\em \menuitemstyle{}}{\em field}\space{}`
`{\em (algebra)}` a `\spadgloss{domain}` which is `\spadgloss{ring}` where every non-zero element is invertible and where `\spad{xy=yx}`; a member of category `\spadtype{Field}`. For a complete list of fields, `{}` click on `{\em Domains}` under `{\em Cross Reference}` for `\spadtype{Field}`.

`\item\newline{\em \menuitemstyle{}}{\em file}\space{}`
a program or collection of data stored on disk, `{}` tape or other medium.

`\item\newline{\em \menuitemstyle{}}{\em float}\space{}`
a floating-point number with user-specified precision; an element of domain `\spadtype{Float}`. Floats are `\spadgloss{literals}` which are written two ways: without an exponent (`\spadignore{e.g.} \spad{3.1416}`), `{}` or with an exponent (`\spadignore{e.g.} \spad{3.12E-12}`). Use function `\spadgloss{precision}` to change the precision of the mantissage

(20 digits by default). See also `\spadgloss{small float}`.

`\item\newline{\em \menuitemstyle{}}{\em formal parameter}\space{}`
 (of a function) an identifier `\spadglossSee{bound}{binding}` to the value of an actual `\spadgloss{argument}` on `\spadgloss{invocation}`. In the function definition `\spad{f(x,{y}) == u},{}` for example, `\spad{x}` and `\spad{y}` are the formal parameter.

`\item\newline{\em \menuitemstyle{}}{\em frame}\space{}`
 the basic unit of an interactive session; each frame has its own `\spadgloss{step number},{}` `\spadgloss{environment},{}` and `\spadgloss{history}`. In one interactive session, `{}` users can create and drop frames, `{}` and have several active frames simultaneously.

`\item\newline{\em \menuitemstyle{}}{\em free}\space{}`
`{\em (syntax)}` A keyword used in user-defined functions to declare that a variable is a `\spadgloss{free variable}` of that function. For example, `{}` the statement `\spad{free x}` declares the variable `\spad{x}` within the body of a function `\spad{f}` to be a free variable in `\spad{f}`. Without such a declaration, `{}` any variable `\spad{x}` which appears on the left hand side of an assignment is regarded as a `\spadgloss{local variable}` of that function. If the intention of the assignment is to give an value to a `\spadgloss{global variable}` `\spad{x},{}` the body of that function must contain the statement `\spad{free x}`.

`\item\newline{\em \menuitemstyle{}}{\em free variable}\space{}`
 (of a function) a variable which appears in a body of a function but is not `\spadglossSee{bound}{binding}` by that function. See `\spadgloss{local variable}` by default.

`\item\newline{\em \menuitemstyle{}}{\em function}\space{}`
 implementation of `\spadgloss{operation}`; it takes zero or more `\spadgloss{argument}` parameters and produces zero or more values. Functions are objects which can be passed as parameters to functions and can be returned as values of functions. Functions can also create other functions (see also `\spadtype{InputForm}`). See also `\spadgloss{application}` and `\spadgloss{invocation}`. The terms `{\em operation}` and `{\em function}` are distinct notions in Axiom. An operation is an abstraction of a function, `{}` described by declaring a `\spadgloss{signature}`. A function is created by providing an implementation of that operation by some piece of Axiom code. Consider the example of defining a user-function `\spad{fact}` to compute the `\spadfun{factorial}` of a nonnegative integer. The Axiom statement `\spad{fact: Integer -> Integer}` describes the operation, `{}` whereas the statement `\spad{fact(n) = reduce(*,{}[1..n])}` defines the functions. See also `\spadgloss{generic function}`.

`\item\newline{\em \menuitemstyle{}}{\em function body}\space{}`
 the part of a `\spadgloss{function}` `\spad{'s}` definition which is evaluated when the function is called at `\spadgloss{run-time}`; the part of the function definition to the right of the `\spadSyntax{\spad{==}}`.

`\item\newline{\em \menuitemstyle{}}{\em garbage collection}\space{}`
 a system function that automatically recycles memory cells from the `\spadgloss{heap}`. Axiom is built upon `\spadgloss{Common LISP}` which provides this facility.

`\item\newline{\em \menuitemstyle{}}{\em garbage collector}\space{}`

a mechanism for reclaiming storage in the `\spadgloss{heap}`.

`\item\newline\em \menuitemstyle{}\{\em Gaussian}\space{}`
 a complex-valued expression, `\spadignore{e.g.}` one with both a real and imaginary part; a member of a `\spadtype{Complex}` domain.

`\item\newline\em \menuitemstyle{}\{\em generic function}\space{}`
 the use of one function to operate on objects of different types; One might regard Axiom as supporting generic `\spadgloss{operations}` but not generic functions. One operation `\spad{+}: (D,{D}) -> D` exists for adding elements in a ring; each ring however provides its own type-specific function for implementing this operation.

`\item\newline\em \menuitemstyle{}\{\em global variable}\space{}`
 A variable which can be referenced freely by functions. In Axiom, `{}` all top-level user-defined variables defined during an interactive user session are global variables. Axiom does not allow `{\em fluid variables}, {}` that is, `{}` variables `\spadglossSee{bound}{binding}` by functions which can be referenced by functions those functions call.

`\item\newline\em \menuitemstyle{}\{\em Groebner basis}\space{}`
`{\em (algebra)}` a special basis for a polynomial ideal that allows a simple test for membership. It is useful in solving systems of polynomial equations.

`\item\newline\em \menuitemstyle{}\{\em group}\space{}`
`{\em (algebra)}` a monoid where every element has a multiplicative inverse.

`\item\newline\em \menuitemstyle{}\{\em hash table}\space{}`
 A data structure that efficiently maps a given object to another. A hash table consists of a set of `{\em entries}, {}` each of which associates a `{\em key}` with a `{\em value}`. Finding the object stored under a key can be very fast even if there are a large number of entries since keys are `{\em hashed}` into numerical codes for fast lookup.

`\item\newline\em \menuitemstyle{}\{\em heap}\space{}`
 an area of storage used by data in programs. For example, `{}` Axiom will use the heap to hold the partial results of symbolic computations. When cancellations occur, `{}` these results remain in the heap until `\spadglossSee{garbage collected}{garbage collector}`.

`\item\newline\em \menuitemstyle{}\{\em history}\space{}`
 a mechanism which records the results for an interactive computation. Using the history facility, `{}` users can save computations, `{}` review previous steps of a computation, `{}` and restore a previous interactive session at some later time. For details, `{}` issue the system command `{\em }history ?` to the interpreter. See also `\spadgloss{frame}`.

`\item\newline\em \menuitemstyle{}\{\em ideal}\space{}`
`{\em (algebra)}` a subset of a ring that is closed under addition and multiplication by arbitrary ring elements, `\spadignore{i.e.}` it `\spad{'}s` a module over the ring.

`\item\newline\em \menuitemstyle{}\{\em identifier}\space{}`
`{\em (syntax)}` an Axiom name; a `\spadgloss{literal}` of type `\spadtype{Symbol}`. An identifier begins with an alphabetical character or `\%` and may be followed by alphabetic characters, `{}` digits, `{}` `?` or `!`. Certain distinguished `\spadgloss{reserved words}` are not allowed as identifiers but have special meaning in the Axiom.

`\item\newline\em \menuitemstyle{}\{\em immutable}\space{}`

an object is immutable if it cannot be changed by an `\spadgloss{operation}`;
not a `\spadglossSee{mutable object}{mutable}`. Algebraic objects generally
immutable: changing an algebraic expression involves copying parts of the
original object. One exception is a matrix object of type `\spadtype{Matrix}`.
Examples of mutable objects are data structures such as those of type
`\spadtype{List}`. See also `\spadgloss{pointer semantics}`.
`\item\newline{\em \menuitemstyle{}}{\em implicit export}\space{}`
(of a domain or category) any `\spadgloss{attribute}` or
`\spadgloss{operation}` which is either an explicit export or else an
explicit export of some category which an explicit category export
`\spadglossSee{extends}{category extension}`.
`\item\newline{\em \menuitemstyle{}}{\em index}\space{}`
1. a variable that counts the number of times a `\spadgloss{loop}` is
repeated. 2. the "address" of an element in a data structure (see also
category `\spadtype{LinearAggregate}`).
`\item\newline{\em \menuitemstyle{}}{\em infix}\space{}`
`{\em (syntax)}` an `\spadgloss{operator}` placed between two
`\spadgloss{operands}`; also called a `{\em binary operator}`,
`\spadignore{e.g.} \spad{a + b}`. An infix operator may also be used as a
`\spadgloss{prefix}`,
`\spadignore{e.g.} \spad{+(a,{b})}` is also permissible
in the Axiom language. Infix operators have a relative
`\spadgloss{precedence}`.
`\item\newline{\em \menuitemstyle{}}{\em input area}\space{}`
a rectangular area on a Hyperdoc screen into which users can enter text.
`\item\newline{\em \menuitemstyle{}}{\em instantiate}\space{}`
to build a `\spadgloss{category}`,
`\spadgloss{domain}`,
`\spadgloss{package}` at run-time
`\item\newline{\em \menuitemstyle{}}{\em integer}\space{}`
a `\spadgloss{literal}` object of domain `\spadtype{Integer}`,
the class
of integers with an unbounded number of digits. Integer literals consist
of one or more consecutive digits (0-9) with no embedded blanks.
Underscores can be used to separate digits in long integers if desirable.
`\item\newline{\em \menuitemstyle{}}{\em interactive}\space{}`
a system where the user interacts with the computer step-by-step
`\item\newline{\em \menuitemstyle{}}{\em interpreter}\space{}`
the subsystem of Axiom responsible for handling user input during
an interactive session. The following somewhat simplified description of
the typical action of the interpreter. The interpreter parses the
user's input expression to create an expression tree then does a
bottom-up traversal of the tree. Each subtree encountered which is not a
value consists of a root node denoting an operation name and one or more
leaf nodes denoting `\spadgloss{operands}`. The interpreter resolves type
mismatches and uses type-inferencing and a library database to determine
appropriate types of the operands and the result,
and an operation to
be performed. The interpreter then builds a domain to perform the
indicated operation,
then invokes a function from the domain to compute
a value. The subtree is then replaced by that value and the process
continues. Once the entire tree has been processed,
the value replacing
the top node of the tree is displayed back to the user as the value of the
expression.

\item\newline{\em \menuitemstyle{}}{\em invocation}\space{}
 (of a function) the run-time process involved in
 \spadglossSee{evaluating}{evaluation} a a \spadgloss{function}
 \spadgloss{application}. This process has two steps. First,{} a
 local \spadgloss{environment} is created where \spadgloss{formal arguments}
 are locally \spadglossSee{bound}{binding} by \spadgloss{assignment} to
 their respective actual \spadgloss{argument}. Second,{} the
 \spadgloss{function body} is evaluated in that local environment.
 The evaluation of a function is terminated either by completely
 evaluating the function body or by the evaluation of a
 \spadSyntax{return} expression.

\item\newline{\em \menuitemstyle{}}{\em iteration}\space{}
 repeated evaluation of an expression or a sequence of expressions.
 Iterations use the reserved words \spadSyntax{for},{}
 \spadSyntax{while},{} and \spadSyntax{repeat}.

\item\newline{\em \menuitemstyle{}}{\em Join}\space{}
 a primitive Axiom function taking two or more categories as
 arguments and producing a category containing all of the operations
 and attributes from the respective categories.

\item\newline{\em \menuitemstyle{}}{\em KCL}\space{}
 Kyoto Common LISP,{} a version of \spadgloss{Common LISP} which
 features compilation of the compilation of LISP into the \spad{C}
 Programming Language

\item\newline{\em \menuitemstyle{}}{\em library}\space{}
 In Axiom,{} a collection of compiled modules representing
 the \spadgloss{category} or \spadgloss{domain} constructor.

\item\newline{\em \menuitemstyle{}}{\em lineage}\space{}
 the sequence of \spadgloss{default packages} for a given domain to be
 searched during \spadgloss{dynamic lookup}. This sequence is computed
 first by ordering the category \spadgloss{ancestors} of the domain
 according to their {\em level number},{} an integer equal to to the
 minimum distance of the domain from the category. Parents have level
 1,{} parents of parents have level 2,{} and so on. Among categories
 with equal level numbers,{} ones which appear in the left-most branches
 of {\em Join}\spad{s} in the source code come first. See also
 \spadgloss{dynamic lookup}.

\item\newline{\em \menuitemstyle{}}{\em LISP}\space{}
 acronym for List Processing Language,{} a language designed for the
 manipulation of nonnumerical data. The Axiom library is
 translated into LISP then compiled into machine code by an underlying LISP.

\item\newline{\em \menuitemstyle{}}{\em list}\space{}
 an object of a \spadtype{List} domain.

\item\newline{\em \menuitemstyle{}}{\em literal}\space{}
 an object with a special syntax in the language. In Axiom,{}
 there are five types of literals: \spadgloss{booleans},{}
 \spadgloss{integers},{} \spadgloss{floats},{} \spadgloss{strings},{}
 and \spadgloss{symbols}.

\item\newline{\em \menuitemstyle{}}{\em local}\space{}
 {\em (syntax)} A keyword used in user-defined functions to declare that
 a variable is a \spadgloss{local variable} of that function. Because of

default assumptions on variables,{} such a declaration is not necessary but is available to the user for clarity when appropriate.

`\item\newline{\em \menuitemstyle{}}{\em local variable}\space{}`
 (of a function) a variable `\spadglossSee{bound}{binding}` by that function and such that its binding is invisible to any function that function calls. Also called a `{\em lexical}` variable. By default in the interpreter:`\begin{items}` `\item` 1. any variable `\spad{x}` which appears on the left hand side of an assignment is regarded a local variable of that function. If the intention of an assignment is to change the value of a `\spadgloss{global variable}` `\spad{x}`,{} the body of the function must then contain the statement `\spad{free x}`. `\item` 2. any other variable is regarded as a `\spadgloss{free variable}`. `\end{items}` An optional declaration `\spad{local x}` is available to explicitly declare a variable to be a local variable. All `\spadgloss{formal parameters}` to the function can be regarded as local variables to the function.

`\item\newline{\em \menuitemstyle{}}{\em loop}\space{}`
 1. an expression containing a `\spadSyntax{repeat}` 2. a collection expression having a `\spadSyntax{for}` or a `\spadSyntax{while}`,{} `\spadignore{e.g.}` `\spad{[f(i) for i in S]}`.

`\item\newline{\em \menuitemstyle{}}{\em loop body}\space{}`
 the part of a loop following the `\spadSyntax{repeat}` that tells what to do each iteration. For example,{} the body of the loop `\spad{for x in S repeat B}` is `\spad{B}`. For a collection expression,{} the body of the loop precedes the initial `\spadSyntax{for}` or `\spadSyntax{while}`.

`\item\newline{\em \menuitemstyle{}}{\em macro}\space{}`
`{\em (syntax)}` 1. An expression of the form `\spad{macro a == b}` where `\spad{a}` is a `\spadgloss{symbol}` causes `\spad{a}` to be textually replaced by the expression `\spad{b}` at `\spadgloss{parse}` time. 2. An expression of the form `\spad{macro f(a) == b}` defines a parameterized macro expansion for a parameterized form `\spad{f}` This macro causes a form `\spad{f}(\spad{x})` to be textually replaced by the expression `\spad{c}` at parse time,{} where `\spad{c}` is the expression obtained by replacing `\spad{a}` by `\spad{x}` everywhere in `\spad{b}`. See also `\spadgloss{definition}` where a similar substitution is done during `\spadgloss{evaluation}`.

`\item\newline{\em \menuitemstyle{}}{\em mode}\space{}`
 a type expression containing a question-mark (`{\em ?}`). For example,{} the mode `{\em P ?}` designates `{\em the class of all polynomials over an arbitrary ring}`.

`\item\newline{\em \menuitemstyle{}}{\em mutable}\space{}`
 objects which contain `\spadgloss{pointers}` to other objects and which have operations defined on them which alter these pointers. Contrast `\spadgloss{immutable}`. Axiom uses `\spadgloss{pointer semantics}` as does `\spadgloss{LISP}` in contrast with many other languages such as Pascal which use `\spadgloss{copying semantics}`. See `\spadgloss{pointer semantics}` for details.

`\item\newline{\em \menuitemstyle{}}{\em name}\space{}`
 1. a `\spadgloss{symbol}` denoting a `\spadgloss{variable}`,{} `\spadignore{i.e.}` the variable `\spad{x}`. 2. a `\spadgloss{symbol}` denoting an `\spadgloss{operation}`,{} `\spadignore{i.e.}` the operation `\spad{divide: (Integer,{}Integer) -> Integer}`.

`\item\newline{\em \menuitemstyle{}}{\em nullary}\space{}`
 a function with no arguments,{ } `\spadignore{e.g.} \spadfun{characteristic}.`
`\item\newline{\em \menuitemstyle{}}{\em nullary}\space{}`
 operation or function with `\spadgloss{arity} 0`
`\item\newline{\em \menuitemstyle{}}{\em Object}\space{}`
 a category with no operations or attributes,{ } from which most categories
 in Axiom are `\spadglossSee{extensions}{category extension}.`
`\item\newline{\em \menuitemstyle{}}{\em object}\space{}`
 a data entity created or manipulated by programs. Elements of domains,{ }
 functions,{ } and domains themselves are objects. Whereas categories are
 created by functions,{ } they cannot be dynamically manipulated in the
 current system and are thus not considered as objects. The most basic
 objects are `\spadgloss{literals}`; all other objects must be created
`\spadgloss{functions}`. Objects can refer to other objects using
`\spadgloss{pointers}`. Axiom language uses
`\spadgloss{pointer semantics}` when dealing with `\spadgloss{mutable}` objects.
`\item\newline{\em \menuitemstyle{}}{\em object code}\space{}`
 code which can be directly executed by hardware; also known as
`{\em machine language}.`
`\item\newline{\em \menuitemstyle{}}{\em operand}\space{}`
 an argument of an `\spadgloss{operator}` (regarding an operator as a
`\spadgloss{function}`).
`\item\newline{\em \menuitemstyle{}}{\em operation}\space{}`
 an abstraction of a `\spadgloss{function}`,{ } described by a
`\spadgloss{signature}`. For example,{ }
`\center{\spad{fact: NonNegativeInteger -> NonNegativeInteger}}` describes
 an operation for "the factorial of a (non-negative) integer".
`\item\newline{\em \menuitemstyle{}}{\em operator}\space{}`
 special reserved words in the language such as `\spadop{+}` and `\spadop{*}`;
 operators can be either `\spadgloss{prefix}` or `\spadgloss{infix}` and have a
 relative `\spadgloss{precedence}`.
`\item\newline{\em \menuitemstyle{}}{\em overloading}\space{}`
 the use of the same name to denote distinct functions; a function is
 identified by a `\spadgloss{signature}` identifying its name,{ } the number
 and types of its arguments,{ } and its return types. If two functions can
 have identical signatures,{ } a `\spadgloss{package call}` must be made to
 distinguish the two.
`\item\newline{\em \menuitemstyle{}}{\em package}\space{}`
 a domain whose exported operations depend solely on the parameters and
 other explicit domains,{ } `\spadignore{e.g.} a package for solving systems`
`of equations of polynomials over any field,{ } \spadignore{e.g.} floats,{ }`
`rational numbers,{ } complex rational functions,{ } or power series.`
`Facilities for integration,{ } differential equations,{ } solution of`
`linear or polynomial equations,{ } and group theory are provided by`
`"packages". Technically,{ } a package is a domain which has no`
`\spadgloss{signature} containing the symbol \$. While domains intuitively`
`provide computational objects you can compute with,{ } packages intuitively`
`provide functions (\spadgloss{polymorphic} functions) which will work over`
`a variety of datatypes.`
`\item\newline{\em \menuitemstyle{}}{\em package call}\space{}`

{\em (syntax)} an expression of the form \spad{e \ \$ D} where \spad{e} is an \spadgloss{application} and \spad{D} denotes some \spadgloss{package} (or \spadgloss{domain}).

\item\newline{\em \menuitemstyle{}}{\em package call}\space{}
 {\em (syntax)} an expression of the form \spad{f(x,{y})\ \$D} used to identify that the function \spad{f} is to be one from \spad{D}.

\item\newline{\em \menuitemstyle{}}{\em package constructor}\space{}
 same as \spadgloss{domain constructor}.

\item\newline{\em \menuitemstyle{}}{\em parameter}\space{}
 see \spadgloss{argument}

\item\newline{\em \menuitemstyle{}}{\em parameterized datatype}\space{}
 a domain that is built on another,{ for example,{ polynomials with integer coefficients.

\item\newline{\em \menuitemstyle{}}{\em parameterized form}\space{}
 a expression of the form \spad{f(x,{y})},{ an \spadgloss{application} of a function.

\item\newline{\em \menuitemstyle{}}{\em parent}\space{}
 (of a domain) a category which is explicitly declared in the source code definition for the domain to be an \spadgloss{export} of the domain.

\item\newline{\em \menuitemstyle{}}{\em parse}\space{}
 1. (verb) to produce an internal representation of a user input string; the resultant internal representation is then "interpreted" by Axiom to perform some indicated action.

\item\newline{\em \menuitemstyle{}}{\em parse}\space{}
 the transformation of a user input string representing a valid Axiom expression into an internal representation as a tree-structure.

\item\newline{\em \menuitemstyle{}}{\em partially ordered set}\space{}
 a set with a reflexive,{ transitive and antisymmetric \spadgloss{binary} operation.

\item\newline{\em \menuitemstyle{}}{\em pattern match}\space{}
 1. (on expressions) Given a expression called a "subject" \spad{u},{ the attempt to rewrite \spad{u} using a set of "rewrite rules". Each rule has the form \spad{A == B} where \spad{A} indicates a expression called a "pattern" and \spad{B} denotes a "replacement". The meaning of this rule is "replace \spad{A} by \spad{B}". If a given pattern \spad{A} matches a subexpression of \spad{u},{ that subexpression is replaced by \spad{B}. Once rewritten,{ pattern matching continues until no further changes occur.

2. (on strings) the attempt to match a string indicating a "pattern" to another string called a "subject",{ for example,{ for the purpose of identifying a list of names. In \Browse{},{ users may enter \spadgloss{search strings} for the purpose of identifying constructors,{ operations,{ and attributes.

\item\newline{\em \menuitemstyle{}}{\em pile}\space{}
 alternate syntax for a block,{ using indentation and column alignment (see also \spadgloss{block}).

\item\newline{\em \menuitemstyle{}}{\em pointer}\space{}
 a reference implemented by a link directed from one object to another in the computer memory. An object is said to {\em refer} to another if it has a pointer to that other object. Objects can also refer to themselves (cyclic references are legal). Also more than one object can refer to the

same object. See also `\spadgloss{pointer semantics}`.

`\item\newline{\em \menuitemstyle{}}{\em pointer semantics}\space{}`
the programming language semantics used in languages such as LISP which allow objects to be `\spadgloss{mutable}`. Consider the following sequence of Axiom statements:
`\begin{items} \item \spad{x : Vector Integer := [1,{}4,{}7]} \item \spad{y := x} \item \spad{swap!(x,{}2,{}3)} \end{items}`
The function `\spadfunFrom{swap!}{Vector}` is used to interchange the 2nd and 3rd value in the list `\spad{x}` producing the value `\spad{[1,{}7,{}4]}`. What value does `\spad{y}` have after evaluation of the third statement? The answer is different in Axiom than it is in a language with `\spadgloss{copying semantics}`. In Axiom, first the vector `[1,{}2,{}3]` is created and the variable `\spad{x}` set to `\spadglossSee{point}{pointer}` to this object. Let `\spad{'s}` call this object `\spad{V}`. Now `\spad{V}` refers to its `\spadgloss{immutable}` components 1, 2, and 3. Next, the variable `\spad{y}` is made to point to `\spad{V}` just as `\spad{x}` does. Now the third statement interchanges the last 2 elements of `\spad{V}` (the `\em !` at the end of the name `\spadfunFrom{swap!}{Vector}` tells you that this operation is destructive, that is, it changes the elements `\em in place`). Both `\spad{x}` and `\spad{y}` perceive this change to `\spad{V}`. Thus both `\spad{x}` and `\spad{y}` then have the value `\spad{[1,{}7,{}4]}`. In Pascal, the second statement causes a copy of `\spad{V}` to be stored under `\spad{y}`. Thus the change to `\spad{V}` made by the third statement does not affect `\spad{y}`.

`\item\newline{\em \menuitemstyle{}}{\em polymorphic}\space{}`
a `\spadgloss{function}` parameterized by one or more `\spadgloss{domains}`; a `\spadgloss{algorithm}` defined `\spadglossSee{categorically}{category}`. Every function defined in a domain or package constructor with a domain-valued parameter is polymorphic. For example, the same matrix `\spadSyntax{*}` function is used to multiply "matrices over integers" as "matrices over matrices over integers" Likewise, various `\ignore{\spad{???}}` in `\ignore{\spad{???}}` solves polynomial equations over any `\spadgloss{field}`.

`\item\newline{\em \menuitemstyle{}}{\em postfix}\space{}`
an `\spadgloss{operator}` that follows its single `\spadgloss{operand}`. Postfix operators are not available in Axiom.

`\item\newline{\em \menuitemstyle{}}{\em precedence}\space{}`
`\em (syntax)` refers to the so-called `\em binding power` of an operator. For example, `\spad{*}` has higher binding power than `\spad{+}` so that the expression `\spad{a + b * c}` is equivalent to `\spad{a + (b * c)}`.

`\item\newline{\em \menuitemstyle{}}{\em precision}\space{}`
the number of digits in the specification of a number, `\spadignore{e.g.}` as set by `\spadfunFrom{precision}{Float}`.

`\item\newline{\em \menuitemstyle{}}{\em predicate}\space{}`
1. a Boolean valued function, `\spadignore{e.g.}` `\spad{odd: Integer -> Boolean}`. 2. an Boolean valued expression

`\item\newline{\em \menuitemstyle{}}{\em prefix}\space{}`
`\em (syntax)` an `\spadgloss{operator}` such as `\spad{-}` and `\spad{not}` that is written `\em before` its single `\spadgloss{operand}`. Every function of one argument can be used as a prefix operator. For example,

all of the following have equivalent meaning in Axiom: `\spad{f(x)}`, `{}`
`\spad{f x}`, `{}` and `\spad{f.x}`. See also `\spadgloss{dot notation}`.
`\item\newline{\em \menuitemstyle{}}{\em quote}\space{}`
the prefix `\spadgloss{operator}` `\spadSyntax{'}` meaning `{\em do not evaluate}`.
`\item\newline{\em \menuitemstyle{}}{\em Record}\space{}`
(basic domain constructor) a domain constructor used to create a
inhomogeneous aggregate composed of pairs of "selectors" and
`\spadgloss{values}`. A Record domain is written in the form
`\spad{Record(a1:D1,{},...,{}an:Dn)}` (`\spad{n} > 0`) where
`\spad{a1}`, `{}`, ..., `{}` `\spad{an}` are identifiers called the
`{\em selectors}` of the record, `{}` and `\spad{D1}`, `{}`, ..., `{}` `\spad{Dn}`
are domains indicating the type of the component stored under selector
`\spad{an}`.
`\item\newline{\em \menuitemstyle{}}{\em recurrence relation}\space{}`
A relation which can be expressed as a function `\spad{f}` with some
argument `\spad{n}` which depends on the value of `\spad{f}` at `\spad{k}`
previous values. In many cases, `{}` Axiom will rewrite a recurrence
relation on compilation so as to `\spadgloss{cache}` its previous `\spad{k}`
values and therefore make the computation significantly more efficient.
`\item\newline{\em \menuitemstyle{}}{\em recursion}\space{}`
use of a self-reference within the body of a function. Indirect recursion
is when a function uses a function below it in the call chain.
`\item\newline{\em \menuitemstyle{}}{\em recursive}\space{}`
1. A function that calls itself, `{}` either directly or indirectly through
another function. 2. self-referential. See also `\spadgloss{recursive}`.
`\item\newline{\em \menuitemstyle{}}{\em reference}\space{}`
see `\spadgloss{pointer}`
`\item\newline{\em \menuitemstyle{}}{\em Rep}\space{}`
a special identifier used as `\spadgloss{local variable}` of a domain
constructor body to denote the representation domain for objects of a domain.
`\item\newline{\em \menuitemstyle{}}{\em representation}\space{}`
a `\spadgloss{domain}` providing a data structure for elements of a
domain; generally denoted by the special identifier `\spadgloss{Rep}`
in the Axiom programming language. As domains are
`\spadgloss{abstract datatypes}`, `{}` this representation is not available
to users of the domain, `{}` only to functions defined in the
`\spadgloss{function body}` for a domain constructor. Any domain can be used
as a representation.
`\item\newline{\em \menuitemstyle{}}{\em reserved word}\space{}`
a special sequence of non-blank characters with special meaning in the
Axiom language. Examples of reserved words are names such as
`\spadSyntax{for}`, `{}` `\spadSyntax{if}`, `{}` and `\spadSyntax{free}`, `{}` operator
names such as `\spadSyntax{+}` and `\spad{mod}`, `{}` special character strings
such as `\spadSyntax{\spad{==}}` and `\spadSyntax{\spad{:=}}`.
`\item\newline{\em \menuitemstyle{}}{\em retraction}\space{}`
to move an object in a parameterized domain back to the underlying
domain, `{}` for example to move the object `\spad{7}` from a "fraction of
integers" (domain `\spadtype{Fraction Integer}`) to "the integers"
(domain `\spadtype{Integer}`).
`\item\newline{\em \menuitemstyle{}}{\em return}\space{}`

when leaving a function,{} the value of the expression following
`\spadSyntax{return}` becomes the value of the function.

`\item\newline{\em \menuitemstyle{}}{\em ring}\space{}`
 a set with a commutative addition,{} associative multiplication,{}
 a unit element,{} and multiplication distributes over addition and
 subtraction.

`\item\newline{\em \menuitemstyle{}}{\em rule}\space{}`
`{\em (syntax)}` 1. An expression of the form `\spad{rule A == B}`
 indicating a "rewrite rule". 2. An expression of the form
`\spad{rule (R1;...;Rn)}` indicating a set of "rewrite rules"
`\spad{R1},{}...{} \spad{Rn}`. See `\spadgloss{pattern matching}` for details.

`\item\newline{\em \menuitemstyle{}}{\em run-time}\space{}`
 the time of doing a computation. Contrast `\spadgloss{compile-time}`.
 rather than prior to it; `\spadgloss{dynamic}` as opposed to
`\spadgloss{static}`. For example,{} the decision of the interpreter
 to build a structure such as "matrices with power series entries"
 in response to user input is made at run-time.

`\item\newline{\em \menuitemstyle{}}{\em run-time check}\space{}`
 an error-checking which can be done only when the program receives
 user input; for example,{} confirming that a value is in the proper
 range for a computation.

`\item\newline{\em \menuitemstyle{}}{\em search string}\space{}`
 a string entered into an `\spadgloss{input area}` on a Hyperdoc screen

`\item\newline{\em \menuitemstyle{}}{\em selector}\space{}`
 an identifier used to address a component value of a `gloss{Record}` datatype.

`\item\newline{\em \menuitemstyle{}}{\em semantics}\space{}`
 the relationships between symbols and their meanings. The rules for
 obtaining the `{\em meaning}` of any syntactically valid expression.

`\item\newline{\em \menuitemstyle{}}{\em semigroup}\space{}`
`{\em (algebra)}` a `\spadgloss{monoid}` which need not have an identity;
 it is closed and associative.

`\item\newline{\em \menuitemstyle{}}{\em side effect}\space{}`
 action which changes a component or structure of a value. See
`\spadgloss{destructive operation}` for details.

`\item\newline{\em \menuitemstyle{}}{\em signature}\space{}`
`{\em (syntax)}` an expression describing an `\spadgloss{operation}`.
 A signature has the form as `\spad{name : source -> target},{} where`
`\spad{source}` gives the type of the arguments of the operation,{} and
`\spad{target}` gives the type of the result.

`\item\newline{\em \menuitemstyle{}}{\em small float}\space{}`
 the domain for hardware floating point arithmetic as provided by the
 computer hardware.

`\item\newline{\em \menuitemstyle{}}{\em small integer}\space{}`
 the domain for hardware integer arithmetic. as provided by the computer
 hardware.

`\item\newline{\em \menuitemstyle{}}{\em source}\space{}`
 the `\spadgloss{type}` of the argument of a `\spadgloss{function}`; the type
 expression before the `\spad{->}` in a `\spadgloss{signature}`. For example,{}
 the source of `\spad{f : (Integer,{}Integer) -> Integer}` is
`\spad{(Integer,{}Integer)}`.

\item\newline{\em \menuitemstyle{}}{\em sparse}\space{}
data structure whose elements are mostly identical (a sparse matrix is one filled with mostly zeroes).

\item\newline{\em \menuitemstyle{}}{\em static}\space{}
that computation done before run-time,{} such as compilation. Contrast \spadgloss{dynamic}.

\item\newline{\em \menuitemstyle{}}{\em step number}\space{}
the number which precedes user input lines in an interactive session; the output of user results is also labeled by this number.

\item\newline{\em \menuitemstyle{}}{\em stream}\space{}
an object of \spadtype{Stream(R)},{} a generalization of a \spadgloss{list} to allow an infinite number of elements. Elements of a stream are computed "on demand". Strings are used to implement various forms of power series (\ignore{\spad{???}}).

\item\newline{\em \menuitemstyle{}}{\em string}\space{}
an object of domain \spadtype{String}. Strings are \spadgloss{literals} consisting of an arbitrary sequence of \spadgloss{characters} surrounded by double-quotes (\spadSyntax{"}),{} \spadignore{e.g.} \spad{"Look here!"}.

\item\newline{\em \menuitemstyle{}}{\em subdomain}\space{}
{\em (basic concept)} a \spadgloss{domain} together with a \spadgloss{predicate} characterizing which members of the domain belong to the subdomain. The exports of a subdomain are usually distinct from the domain itself. A fundamental assumption however is that values in the subdomain are automatically \spadglossSee{coerceable}{coercion} to values in the domain. For example,{} if \spad{n} and \spad{m} are declared to be members of a subdomain of the integers,{} then {\em any} \spadgloss{binary} operation from \spadtype{Integer} is available on \spad{n} and \spad{m}. On the other hand,{} if the result of that operation is to be assigned to,{} say,{} \spad{k},{} also declared to be of that subdomain,{} a \spadgloss{run-time} check is generally necessary to ensure that the result belongs to the subdomain.

\item\newline{\em \menuitemstyle{}}{\em such that clause}\space{}
the use of \spadSyntax{|} followed by an expression to filter an iteration.

\item\newline{\em \menuitemstyle{}}{\em suffix}\space{}
{\em (syntax)} an \spadgloss{operator} which placed after its operand. Suffix operators are not allowed in the Axiom language.

\item\newline{\em \menuitemstyle{}}{\em symbol}\space{}
objects denoted by \spadgloss{identifier} \spadgloss{literals}; an element of domain \spadtype{Symbol}. The interpreter defaultly converts a symbol \spad{x} into \spadtype{Variable(x)}.

\item\newline{\em \menuitemstyle{}}{\em syntax}\space{}
rules of grammar,{} punctuation etc. for forming correct expressions.

\item\newline{\em \menuitemstyle{}}{\em system commands}\space{}
top-level Axiom statements that begin with {\em }}. System commands allow users to query the database,{} read files,{} trace functions,{} and so on.

\item\newline{\em \menuitemstyle{}}{\em tag}\space{}
an identifier used to discriminate a branch of a \spadgloss{Union} type.

\item\newline{\em \menuitemstyle{}}{\em target}\space{}
the \spadgloss{type} of the result of a \spadgloss{function}; the

type expression following the `\spad{->}` in a `\spadgloss{signature}`.

`\item\newline\em \menuitemstyle{}\{\em top-level\}\space{}`
 refers to direct user interactions with the Axiom interpreter.

`\item\newline\em \menuitemstyle{}\{\em totally ordered set\}\space{}`
`\em (algebra)}` a partially ordered set where any two elements are comparable.

`\item\newline\em \menuitemstyle{}\{\em trace\}\space{}`
 use of system function `\spadsys{}trace` to track the arguments passed to a function and the values returned.

`\item\newline\em \menuitemstyle{}\{\em tuple\}\space{}`
 an expression of two or more other expressions separated by commas,`{}`
`\spadignore{e.g.} \spad{4,{7,{11}}`. Tuples are also used for multiple arguments both for `\spadgloss{applications}` (`\spadignore{e.g.} \spad{f(x,{y})}`) and in `\spadgloss{signatures}` (`\spadignore{e.g.} \spad{(Integer,{Integer}) -> Integer}`). A tuple is not a data structure,`{}` rather a syntax mechanism for grouping expressions.

`\item\newline\em \menuitemstyle{}\{\em type\}\space{}`
 The type of any `\spadgloss{subdomain}` is the unique symbol `\em Category`. The type of a `\spadgloss{domain}` is any `\spadgloss{category}` that domain belongs to. The type of any other object is either the (unique) domain that object belongs to or any `\spadgloss{subdomain}` of that domain. The type of objects is in general not unique.

`\item\newline\em \menuitemstyle{}\{\em type checking\}\space{}`
 a system function which determines whether the datatype of an object is appropriate for a given operation.

`\item\newline\em \menuitemstyle{}\{\em type constructor\}\space{}`
 a `\spadgloss{domain constructor}` or `\spadgloss{category constructor}`.

`\item\newline\em \menuitemstyle{}\{\em type inference\}\space{}`
 when the interpreter chooses the type for an object based on context. For example,`{}` if the user interactively issues the definition `\center{\spad{f(x) == (x + \%i)**2}}` then issues `\spad{f(2)},{}` the interpreter will infer the type of `\spad{f}` to be `\spad{Integer -> Complex Integer}`.

`\item\newline\em \menuitemstyle{}\{\em unary\}\space{}`
 operation or function with `\spadgloss{arity} 1`

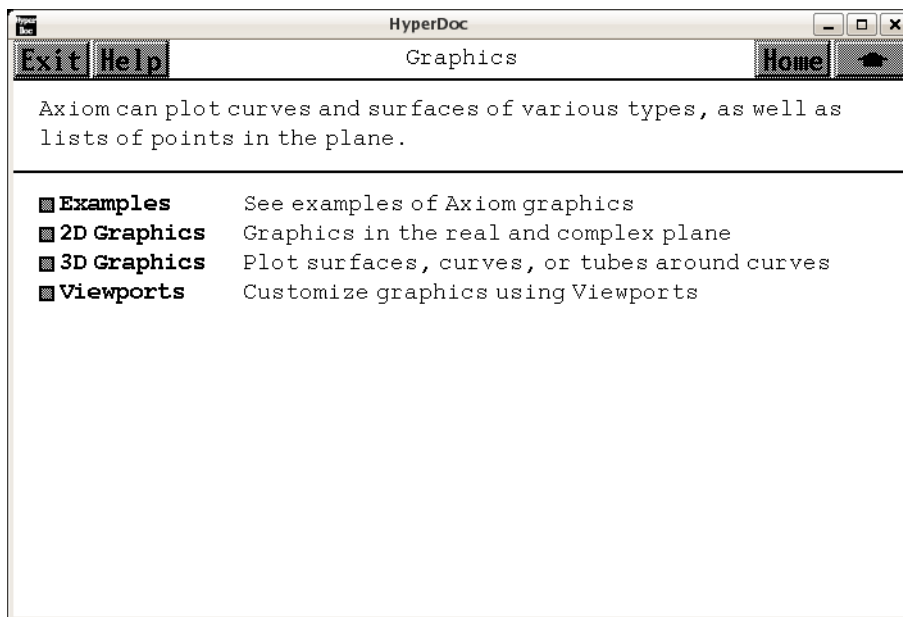

`\item\newline\em \menuitemstyle{}\{\em underlying domain\}\space{}`
 for a `\spadgloss{domain}` that has a single domain-valued parameter,`{}` the `\em underlying domain` refers to that parameter. For example,`{}` the domain "matrices of integers" (`\spadtype{Matrix Integer}`) has underlying domain `\spadtype{Integer}`.

`\item\newline\em \menuitemstyle{}\{\em Union\}\space{}`
 (basic domain constructor) a domain constructor used to combine any set of domains into a single domain. A Union domain is written in the form `\spad{Union(a1:D1,{...},{an:Dn)}` (`\spad{n} > 0`) where `\spad{a1},{...},{\spad{an}}` are identifiers called the `\em tags` of the union,`{}` and `\spad{D1},{...},{\spad{Dn}}` are domains called the `\em branches` of the union. The tags `\spad{\spad{ai}}` are optional,`{}` but required when two of the `\spad{\spad{Di}}` are equal,`{}`
`\spadignore{e.g.} \spad{Union(inches:Integer,{centimeters:Integer})}`. In the interpreter,`{}` values of union domains are automatically coerced

to values in the branches and vice-versa as appropriate. See also
`\spadgloss{case}.`
`\item\newline{\em \menuitemstyle{}}{\em unit}\space{}`
`{\em (algebra)}` an invertible element.
`\item\newline{\em \menuitemstyle{}}{\em user function}\space{}`
a function defined by a user during an interactive session. Contrast
`\spadgloss{built-in function}.`
`\item\newline{\em \menuitemstyle{}}{\em user variable}\space{}`
a variable created by the user at top-level during an interactive session
`\item\newline{\em \menuitemstyle{}}{\em value}\space{}`
1. the result of `\spadglossSee{evaluating}{evaluation}` an expression.
2. a property associated with a `\spadgloss{variable}` in a `\spadgloss{binding}`
in an `\spadgloss{environment}`.
`\item\newline{\em \menuitemstyle{}}{\em variable}\space{}`
a means of referring to an object but itself `{\spad{\bf} not}` an object. A
variable has a name and an associated `\spadgloss{binding}` created by
`\spadgloss{evaluation}` of Axiom expressions such as
`\spadgloss{declarations},{} \spadgloss{assignments},{} and`
`\spadgloss{definitions}`. In the top-level `\spadgloss{environment}` of the
interpreter, `{}` variables are `\spadgloss{global variables}`. Such variables
can be freely referenced in user-defined functions although a
`\spadgloss{free}` declaration is needed to assign values to them.
See `\spadgloss{local variable}` for details.
`\item\newline{\em \menuitemstyle{}}{\em Void}\space{}`
the type given when the `\spadgloss{value}` and `\spadgloss{type}` of an
expression are not needed. Also used when there is no guarantee at
run-time that a value and predictable mode will result.
`\item\newline{\em \menuitemstyle{}}{\em wild card}\space{}`
a symbol which matches any substring including the empty string; for
example, `{}` the search string `{\em *an*}` matches an word containing the
consecutive letters `{\em a}` and `{\em n}`
`\item\newline{\em \menuitemstyle{}}{\em workspace}\space{}`
an interactive record of the user input and output held in an interactive
history file. Each user input and corresponding output expression in the
workspace has a corresponding `\spadgloss{step number}`. The current output
expression in the workspace is referred to as `\spad{\%}`. The output
expression associated with step number `\spad{n}` is referred to by
`\spad{\%\%(n)}`. The `\spad{k}`-th previous output expression relative
to the current step number `\spad{n}` is referred to by `\spad{\%\%(- k)}`.
Each interactive `\spadgloss{frame}` has its own workspace.
`\endmenu\endscroll\lispdownlink{Search}{(|htGloss| "\stringvalue{pattern}")}`
for glossary entry matching `\inputstring{pattern}{24}{*}\end{page}`

\begin{page}{ListPointsGraphicsExamplePage}{Lists of Points}
Axiom has the ability to create lists of points in a two dimensional
graphics viewport. This is done by utilizing the \spadtype{GraphImage}
and \spadtype{TwoDimensionalViewport} domain facilities.

Functions of Two Variables

— graphics.ht —

```
\begin{page}{TwoVariableGraphicsPage}{Functions of Two Variables}
\beginscroll
```

This page describes the plotting of surfaces defined by an equation of two variables, $z = f(x,y)$, for which the ranges of x and y are explicitly defined. The basic draw command for this function utilizes either the uncompiled function or compiled function format. The general format for an uncompiled function is:

```
\indent{5}\newline
{\em draw(f(x,y), x = a..b, y = c..d)}
\indent{0}\newline
```

where $a..b$ and $c..d$ are segments defining the intervals $[a,b]$ and $[c,d]$ over which the variables x and y span. In this case the function is not compiled until the draw command is executed. Here is an example:

```
\graphpaste{draw(cos(x*y),x=-3..3,y=-3..3)}
```

In the case of a compiled function, the function is named and compiled independently. This is useful if you intend to use a function often, or if the function is long and complex. The following line shows a function whose parameters are of the type Small Float. The function is

compiled and stored by Axiom when it is entered.

```
\indent{5}\newline
{\em NOTE: It is only necessary to click on the draw command button to
plot this example}.
```

```
\indent{0}\newline
\spadpaste{f(x:SF,y:SF):SF == sin(x)*cos(y) \bound{f}}
\newline
```

Once the function is compiled the draw command only needs the name of the function to execute. Here is a compiled function example:

```
\graphpaste{draw(f,-\%pi..\%pi,-\%pi..\%pi) \free{f}}
Note that the parameter ranges do not take the variable names as in the
case of uncompiled functions. The variables are entered in the order in
which they are defined in the function specification. In this case the
first range specifies the x-variable and the second range specifies the
y-variable.
```

```
\endscroll
\autobuttons
\end{page}
```

Parametric Space Curves

— graphics.ht —

```

\begin{page}{SpaceCurveGraphicsPage}{Parametric Space Curves}
\begin{scroll}
This page describes the plotting in three dimensional space of a curve
defined by the parametric equations  $x = f(t)$ ,  $y = g(t)$ ,  $z = h(t)$ ,
where  $f$ ,  $g$ , and  $h$  are functions of the parameter  $t$  which ranges over a
specified interval. The basic draw command for this function utilizes
either the uncompiled functions or compiled functions format and uses
the \spadfun{curve} command to specify the three functions for the  $x$ ,
 $y$ , and  $z$  components of the curve. The general format for uncompiled
functions is:
\indent{5}\newline
{\em draw(curve(f(t),g(t),h(t)), t = a..b)}
\indent{0}\newline
where  $a..b$  is the segment defining the interval  $[a,b]$  over which the
parameter  $t$  ranges. In this case the functions are not compiled until
the draw command is executed. Here is an example:
\graphpaste{draw(curve(cos(t),sin(t),t), t=-12..12)}
In the case of compiled functions, the functions are named and
compiled independently. This is useful if you intend to use the
functions often, or if the functions are long and complex. The
following lines show functions whose parameters are of the type Small
Float. The functions are compiled and stored by Axiom when entered.
\indent{5}\newline
{\em NOTE: It is only necessary to click on the draw command button to
plot this example}.
\indent{0}\newline
\spadpaste{i1(t:SF):SF == sin(t)*cos(3*t/5) \bound{i1}}
\spadpaste{i2(t:SF):SF == cos(t)*cos(3*t/5) \bound{i2}}
\spadpaste{i3(t:SF):SF == cos(t)*sin(3*t/5) \bound{i3}}
Once the functions are compiled the draw command only needs the names
of the functions to execute. Here is a compiled functions example:

```

```
\graphpaste{draw(curve(i1,i2,i3),0.15*\%pi) \free{i1 i2 i3}}
```

Note that the parameter range does not take the variable name as in the case of uncompiled functions. It is understood that the indicated range applies to the parameter of the functions, which in this case is t .

Parametric Tube Plots

— graphics.ht —

```

\begin{page}{ParametricTubeGraphicsPage}{Parametric Tube Plots}
\begin{scroll}
This page describes the plotting in three dimensional space of a tube
around a parametric space curve defined by the parametric equations
 $x = f(t)$ ,  $y = g(t)$ ,  $z = h(t)$ , where  $f$ ,  $g$ , and  $h$  are functions of the
parameter  $t$  which ranges over a specified interval. The basic draw
command for this function utilizes either the uncompiled functions or
compiled functions format and uses the \spadfun{curve} command to
specify the three functions for the  $x$ ,  $y$ , and  $z$  components of the
curve. This uses the same format as that for space curves except that
it requires a specification for the radius of the tube. If the radius
of the tube is 0, then the result is the space curve itself. The

```

general format for uncompiled functions is:

```
\indent{5}\newline
{\em draw(curve(f(t),g(t),h(t)), t = a..b, tubeRadius == r)}
\indent{0}\newline
```

where $a..b$ is the segment defining the interval $[a,b]$ over which the parameter t ranges, and the `tubeRadius` is indicated by the variable r . In this case the functions are not compiled until the `draw` command is executed. Here is an example:

```
\graphpaste{draw(curve(sin(t)*cos(3*t/5), cos(t)*cos(3*t/5),
cos(t)*sin(3*t/5)), t=0..15*\%pi,tubeRadius == .15)}
```

In the case of compiled functions, the functions are named and compiled independently. This is useful if you intend to use the functions often, or if the functions are long and complex. The following lines show functions whose parameters are of the type `Small Float`. The functions are compiled and stored by Axiom when entered.

```
\indent{5}\newline
{\em NOTE: It is only necessary to click on the draw command button to
plot this example}.
```

```
\indent{0}\newline
\spadpaste{t1(t:SF):SF == 4/(2-sin(3*t))*cos(2*t) \bound{t1}}
\newline
\spadpaste{t2(t:SF):SF == 4/(2-sin(3*t))*sin(2*t) \bound{t2}}
\newline
\spadpaste{t3(t:SF):SF == 4/(2-sin(3*t))*cos(3*t) \bound{t3}}
\newline
```

Once the function is compiled the `draw` command only needs the names of the functions to execute. Here is a compiled functions example of a trefoil knot:

```
\graphpaste{draw(curve(t1,t2,t3),0..2*\%pi,tubeRadius == .2)
\free{t1 t2 t3}}
```

Note that the parameter range does not take the variable name as in the case of uncompiled functions. It is understood that the indicated range applies to the parameter of the functions, which in this case is t . Typically, the radius of the tube should be set between 0 and 1. A radius of less than 0 results in it's positive counterpart and a radius of greater than one causes self intersection.

Parametric Surfaces

— graphics.ht —

```

\begin{page}{ParametricSurfaceGraphicsPage}{Parametric Surfaces}
\begin{scroll}
Graphing a surface defined by  $x = f(u,v)$ ,  $y = g(u,v)$ ,  $z = h(u,v)$ .
\newline This page describes the plotting of surfaces defined
by the parametric equations of two variables,  $x = f(u,v)$ ,  $y = g(u,v)$ ,
and  $z = h(u,v)$ , for which the ranges of  $u$  and  $v$  are explicitly
defined. The basic draw command for this function utilizes either the
uncompiled function or compiled function format and uses the
\spadfun{surface} command to specify the three functions for the  $x$ ,  $y$ 
and  $z$  components of the surface. The general format for uncompiled
functions is:
\indent{5}\newline
{\em draw(surface(f(u,v),g(u,v),h(u,v)), u = a..b, v = c..d)}
\indent{0}\newline
where  $a..b$  and  $c..d$  are segments defining the intervals  $[a,b]$  and
 $[c,d]$  over which the parameters  $u$  and  $v$  span. In this case the
functions are not compiled until the draw command is executed. Here
is an example of a surface plotted using the parabolic cylindrical
coordinate system option:
\graphpaste{draw(surface(u*cos(v), u*sin(v),v*cos(u)),
u=-4..4,v=0..2*\%pi, coordinates== parabolicCylindrical)}
In the case of compiled functions, the functions are named and
compiled independently. This is useful if you intend to use the
functions often, or if the functions are long and complex. The
following lines show functions whose parameters are of the type Small
Float. The functions are compiled and stored by Axiom when entered.
\indent{5}\newline
{\em NOTE: It is only necessary to click on the draw command button to
plot this example}.
\indent{0}\newline

```

```

\spadpaste{n1(u:SF,v:SF):SF == u*cos(v) \bound{n1}}
\newline
\spadpaste{n2(u:SF,v:SF):SF == u*sin(v) \bound{n2}}
\newline
\spadpaste{n3(u:SF,v:SF):SF == u \bound{n3}}

```

Once the function is compiled the draw command only needs the names of the functions to execute. Here is a compiled functions example plotted using the toroidal coordinate system option: \newline

```

\graphpaste{draw(surface(n1,n2,n3), 1.0..4.0, 1.0..4*\%pi,
    coordinates == toroidal(1\%SF)) \free{n1 n2 n3}}

```

Note that the parameter ranges do not take the variable names as in the case of uncompiled functions. The variables are entered in the order in which they are defined in the function specification. In this case the first range specifies the u-variable and the second range specifies the v-variable.

Building 3D Objects

— graphics.ht —

```

\begin{page}{3DObjectGraphicsPage}{Building 3D Objects}

```

\beginscroll

This page describes the Axiom facilities for creating three dimensional objects constructed from geometric primitives. The Axiom operation `\spadfun{create3Space()}` creates a space to which points, curves, and polygons can be added using the operations from the `\spadtype{ThreeSpace}` domain. The contents of this space can then be displayed in a viewport using the `\spadfun{makeViewport3D()}` command. It will be necessary to have these operations exposed in order to use them. \indent{5}\newline {\em NOTE: It is only necessary to click on the makeViewport3D command button to plot this curve example}.

\indent{0}\newline

Initially, the space which will hold the objects must be defined and compiled, as in the following example:

```
\spadpaste{space := create3Space()\$(ThreeSpace SF) \bound{space}}
```

Now objects can be sent to this {\em space} as per the operations allowed by the `\spadtype{ThreeSpace}` domain. The following examples place curves into

{\em space}.

```
\spadpaste{curve(space, [[0,20,20], [0,20,30], [0,30,30], [0,30,100],
[0,20,100], [0,20,110], [0,50,110], [0,50,100], [0,40,100], [0,40,30],
[0,50,30], [0,50,20], [0,20,20]]) \bound{curveI}}
```

\newline

```
\spadpaste{curve(space, [[0,80,20], [0,70,20], [0,70,110], [0,110,110],
[0,120,100], [0,120,70], [0,115,65], [0,120,60], [0,120,30], [0,110,20],
[0,80,20], [0,80,30], [0,105,30], [0,110,35]]) \bound{curveB1}}
```

\newline

```
\spadpaste{curve(space, [[0,110,35], [0,110,55], [0,105,60], [0,80,60],
[0,80,70], [0,105,70], [0,110,75], [0,110,95], [0,105,100], [0,80,100],
[0,80,30]]) \bound{curveB2}}
```

\newline

```
\spadpaste{closedCurve(space, [[0,140,20], [0,140,110], [0,150,110],
[0,170,50], [0,190,110], [0,200,110], [0,200,20], [0,190,20], [0,190,75],
[0,175,35], [0,165,35], [0,150,75], [0,150,20]]) \bound{curveM}}
```

```
\spadpaste{closedCurve(space, [[200,0,20], [200,0,110], [185,0,110],
[160,0,45], [160,0,110], [150,0,110], [150,0,20], [165,0,20],
[190,0,85], [190,0,20]]) \bound{curveN}}
```

```
\spadpaste{closedCurve(space, [[140,0,20], [120,0,110], [110,0,110],
[90,0,20], [100,0,20], [108,0,50], [123,0,50], [121,0,60],
[110,0,60], [115,0,90], [130,0,20]]) \bound{curveA}}
```

```
\spadpaste{closedCurve(space, [[80,0,30], [80,0,100], [70,0,110],
[40,0,110], [30,0,100], [30,0,90], [40,0,90], [40,0,95],
[45,0,100], [65,0,100], [70,0,95], [70,0,35], [65,0,30],
[45,0,30], [40,0,35], [40,0,60], [50,0,60], [50,0,70],
[30,0,70], [30,0,30], [40,0,20], [70,0,20]]) \bound{curveG}}
```

Once {\em space} contains the desired elements a viewport is created and displayed with the following command:

```
\graphpaste{makeViewport3D(space, [title("Curves")])\VIEW3D
\free{space curveI curveB1 curveB2 curveM curveN curveA curveG}}
```

The parameters for `\spadfun{makeViewport3D()}` in this example are {\em space}, which is the name of the three dimensional space that was

```

defined, and a string, "curve", which is the title for the viewport.
The trailing string {\em \VIEW3D} exposes the command
\spadfun{makeViewport3D()} from the domain
\spadtype{ThreeDimensionalViewport} if these commands are unexposed.

Functions of One Variable

— graphics.ht —

```
\begin{page}{OneVariableGraphicsPage}{Functions of One Variable}
\beginscroll
Here we wish to plot a function  $y = f(x)$  on an interval  $[a,b]$ .
As an example, let's take the function  $y = \sin(\tan(x)) - \tan(\sin(x))$ 
on the interval  $[0,6]$ .
```

Here is the simplest command that will do this:

```
\graphpaste{draw(sin(tan(x)) - tan(sin(x)),x = 0..6)}
```

Notice that Axiom compiled a function before the graph was put on the screen. The expression $\sin(\tan(x)) - \tan(\sin(x))$ was converted to a compiled function so that its value for various values of x could be computed quickly and efficiently. Let's graph the same function on a different interval and this time we'll give the graph a title. The title is a String, which is an optional argument of the command 'draw'.

```
\graphpaste{draw(sin(tan(x)) - tan(sin(x)),x = 10..16,  
title == "y = sin tan x - tan sin x")}
```

Once again the expression $\sin(\tan(x)) - \tan(\sin(x))$ was converted to a compiled function before any points were computed. If you want to graph the same function on a number of intervals, it's a good idea to write down a function definition so that the function only has to be compiled once.

Here's an example:

```
\spadpaste{f(x) == (x-1)*(x-2)*(x-3) \bound{f}}
```

```
\newline
```

```
\graphpaste{draw(f, 0..2, title == "y = f(x) on \[0,2\]") \free{f}}
```

```
\newline
```

```
\graphpaste{draw(f, 0..4,title == "y = f(x) on \[0,4\]") \free{f}}
```

Notice that our titles can be whatever we want, as long as they are enclosed by double quotes. However, a title which is too long to fit within the viewport title window will be clipped.

```

Parametric Curves

— graphics.ht —

```

\begin{page}{ParametricCurveGraphicsPage}{Parametric Curves}
\beginscroll
One way of producing interesting curves is by using parametric
equations. Let  $x = f(t)$  and  $y = g(t)$  for two functions  $f$  and  $g$  as the
parameter  $t$  ranges over an interval  $[a,b]$ .
Here's an example:
\graphpaste{draw(curve(sin(t)*sin(2*t)*sin(3*t),
sin(4*t)*sin(5*t)*sin(6*t)), t = 0..2*\%pi)}
Here  $0..2*\%pi$  represents the interval over which the variable  $t$  ranges.
In the case of parametric curves, Axiom will compile two functions,
one for each of the functions  $f$  and  $g$ .
You may also put a title on a graph.
The title may be an arbitrary string and is an optional argument
to the command 'draw'.
For example:
\graphpaste{draw(curve(cos(t), sin(t)), t = 0..2*\%pi,
title == "The Unit Circle")}
```

If you plan on plotting $x = f(t)$, $y = g(t)$ as t ranges over several intervals, you may want to define functions f and g , so that they need not be recompiled every time you create a new graph. Here's an example:

```

\spadpaste{f(t:SF):SF == sin(3*t/4) \bound{f}}
\newline
\spadpaste{g(t:SF):SF == sin(t) \bound{g}}
\newline
\graphpaste{draw(curve(f,g), 0..\%pi) \free{f g}}
\newline
\graphpaste{draw(curve(f,g) ,\%pi..2*\%pi) \free{f g}}
\newline
\graphpaste{draw(curve(f,g) , -4*\%pi..4*\%pi) \free{f g}}
```

These examples show how the curve changes as the range of parameter t varies.

Polar Coordinates

— graphics.ht —

```

\begin{page}{PolarGraphicsPage}{Polar Coordinates}
\beginscroll
Graphs in polar coordinates are given by an equation  $r = f(\theta)$  as
 $\theta$  ranges over an interval.
This is equivalent to the parametric curve  $x = f(\theta) * \cos(\theta)$ ,

```

$y = f(\theta) * \sin(\theta)$ as θ ranges over the same interval.

You may create such curves using the command 'draw', with the optional argument 'coordinates == polar'.

Here are some examples:

```
\graphpaste{draw(1,t = 0..2*\%pi,coordinates == polar,
title == "The Unit Circle")}
```

```
\newline
```

```
\graphpaste{draw(sin(17*t), t = 0..2*\%pi, coordinates == polar,
title == "A Petal Curve")}
```

%When you don't specify an interval, Axiom will assume that you mean $0..2*\pi$.

You may also define your own functions, when you plan on plotting the same curve as θ varies over several intervals.

```
\spadpaste{f(t) == cos(4*t/7) \bound{f}}
```

```
\newline
```

```
\graphpaste{draw(f, 0..2*\%pi, coordinates == polar) \free{f}}
```

```
\newline
```

```
\graphpaste{draw(f, 0..14*\%pi, coordinates == polar) \free{f}}
```

For information on plotting graphs in other coordinate systems see the pages for the \spadtype{CoordinateSystems} domain.

Implicit Curves

— graphics.ht —

```

\begin{page}{ImplicitCurveGraphicsPage}{Implicit Curves}
\beginscroll
Axiom has facilities for graphing a non-singular algebraic curve
in a rectangular region of the plane.
An algebraic curve is a curve defined by a polynomial equation
 $p(x,y) = 0$ .
Non-singular means that the curve is "smooth" in that it does not
cross itself or come to a point (cusp).
Algebraically, this means that for any point (a,b) on the curve
(i.e. a point such that  $p(a,b) = 0$ ), the partial derivatives
 $dp/dx(a,b)$  and  $dp/dy(a,b)$  are not both zero.
We require that the polynomial have rational or integral coefficients.
Here is a Cartesian ovals algebraic curve example:
(click on the draw button to execute this example)
\spadpaste{p := ((x**2 + y**2 + 1) - 8*x)**2 -
(8*(x**2 + y**2 + 1) - 4*x - 1) \bound{p} }
\graphpaste{draw(p = 0, x, y, range == \[-1..11, -7..7\],
title == "Cartesian Ovals") \free{p}}
{\em A range must be declared for each variable specified in the
algebraic curve equation}.

```

Lists of Points

— graphics.ht —

```

\begin{page}{ListPointsGraphicsPage}{Lists of Points}
\beginscroll
Axiom has the ability to create lists of points in a two dimensional
graphics viewport. This is done by utilizing the \spadtype{GraphImage}
and \spadtype{TwoDimensionalViewport} domain facilities.
\indent{5}\newline
{\em NOTE: It is only necessary to click on the makeViewport2D command
button to plot this curve example}.
\indent{0}\newline
In this example, the \spadfun{makeGraphImage} command takes a list of
lists of points parameter, a list of colors for each point in the
graph, a list of colors for each line in the graph, and a list of
numbers which indicate the size of each point in the graph. The
following lines create list of lists of points which can be read be
made into two dimensional graph images.
\spadpaste{p1 := point [1::SF,1::SF]\$(Point SF) \bound{p1}}
\newline
\spadpaste{p2 := point [0::SF,1::SF]\$(Point SF) \bound{p2}}
\newline
\spadpaste{p3 := point [0::SF,0::SF]\$(Point SF) \bound{p3}}
\newline
\spadpaste{p4 := point [1::SF,0::SF]\$(Point SF) \bound{p4}}
\newline
\spadpaste{p5 := point [1::SF,.5::SF]\$(Point SF) \bound{p5}}
\newline
\spadpaste{p6 := point [.5::SF,0::SF]\$(Point SF) \bound{p6}}
\newline
\spadpaste{p7 := point [0::SF,0.5::SF]\$(Point SF) \bound{p7}}
\newline
\spadpaste{p8 := point [.5::SF,1::SF]\$(Point SF) \bound{p8}}
\newline
\spadpaste{p9 := point [.25::SF,.25::SF]\$(Point SF) \bound{p9}}
\newline
\spadpaste{p10 := point [.25::SF,.75::SF]\$(Point SF) \bound{p10}}
\newline
\spadpaste{p11 := point [.75::SF,.75::SF]\$(Point SF) \bound{p11}}

```

```

\newline
\spadpaste{p12 := point [.75::SF,.25::SF]\$(Point SF) \bound{p12}}
\newline
\spadpaste{llp := [[p1,p2],[p2,p3],[p3,p4],[p4,p1],[p5,p6],[p6,p7],
[p7,p8],[p8,p5],[p9,p10],[p10,p11],[p11,p12],[p12,p9]] \bound{llp}
\free{p1 p2 p3 p4 p5 p6 p7 p8 p9 p10 p11 p12}}
\newline
These lines set the point color and size, and the line color for
all components of the graph.
\spadpaste{size1 := 6::PositiveInteger \bound{size1}}
\newline
\spadpaste{size2 := 8::PositiveInteger \bound{size2}}
\newline
\spadpaste{size3 := 10::PositiveInteger \bound{size3}}
\newline
\spadpaste{lsize := [size1, size1, size1, size1, size2, size2, size2,
size2, size3, size3, size3, size3] \bound{lsize}
\free{size1 size2 size3}}
\newline
\spadpaste{pc1 := pastel red() \bound{pc1}}
\newline
\spadpaste{pc2 := dim green() \bound{pc2}}
\newline
\spadpaste{pc3 := pastel yellow() \bound{pc3}}
\newline
\spadpaste{lpc := [pc1, pc1, pc1, pc1, pc2, pc2, pc2, pc2, pc3, pc3,
pc3, pc3] \bound{lpc} \free{pc1 pc2 pc3}}
\newline
\spadpaste{lc := [pastel blue(), light yellow(), dim green(),
bright red(), light green(), dim yellow(), bright blue(),
dark red(), pastel red(), light blue(), dim green(),
light yellow()] \bound{lc}}
\newline
Now the graph image is created and named according to the component
specifications indicated above. The \spadfun{makeViewport2D} command
then creates a two dimensional viewport for this graph according to
the list of options specified within the brackets.
\spadpaste{g := makeGraphImage(llp,lpc,lc,lsize)\$GRIMAGE \bound{g}
\free{llp lpc lc lsize}}
\newline
\graphpaste{makeViewport2D(g,[title("Lines")])\$VIEW2D \free{g}}
The \spadfun{makeViewport2D} command takes a list of options as a
parameter. In this example the string "Lines" is designated as the
viewport's title.
\endscroll
\autobuttons

Stand-alone Viewport

— graphics.ht —

```

\begin{page}{ViewportPage}{Stand-alone Viewport}
\beginscroll
To get a viewport on a Hyperdoc page, you first need to
create one in Axiom and write it out to a
file that Hyperdoc can call up. \newline
For example, here we draw a saddle function and assign
the result to the variable \spad{v}:
\newline
\graphpaste{v := draw(x*x-y*y,x=-1..1,y=-1..1) \bound{v}}
\newline
Now that we've created the viewport, we want to write
the data out to a file. \newline
To do this, we use the \spadfunFrom{write}{ThreeDimensionalViewport}
command which takes the following arguments: the viewport to write
out, the title of the file to write it out to, and an optional
argument telling the write command what type (or types) of data you
want to write in addition to the one Axiom will always write
out. The optional argument could be a string, like "pixmap", or a list
of strings, like \["postscript","pixmap"]. Hyperdoc needs a
"pixmap" data type to include a graph in a page so in this case, we
write the viewport and tell it to also write a "pixmap" file, as well:
\newline
\spadpaste{write(v,"saddle","pixmap") \free{v}}
\newline
Now we want to put this viewport into a Hyperdoc page.
Say you've created a viewport and written it out
to a file called "/tmp/mobius". (Axiom actually
tags a ".view" at the end of a viewport data file to
make it easier to spot when you're rummaging through
your file system, but you needn't worry about that here
since Axiom will always automatically add on a
".view" for you.) \newline

```

```

{\bf Including Viewports} \newline
To put a viewport in a
Hyperdoc page, include the following line in your Hyperdoc
source code: \newline
\space{5}\\viewport\{/tmp/mobius\} \newline
You will get this on your page: \newline
%%\space{4}\viewport{/tmp/mobius}\newline
%\space{4}\spadviewport{mobius}\newline
\centerline{\spadviewport{mobius}}\newline

{\bf Creating Viewport Buttons} \newline
To make an active button that would make this viewport
come to life, include the following: \newline
\space{5}\\viewportbutton\{ViewButton\}\{/tmp/mobius\} \newline
this creates this button...\newline
%%\centerline{\viewportbutton{ViewButton}\{/tmp/mobius\}}\newline
\centerline{\spadviewportbutton{ViewButton}{mobius}}\newline

{\bf Creating Active Viewports} \newline
To merge the two things described above, namely, getting a picture of a
viewport and creating a button to invoke a live viewport, you can do
the following: \newline

%\space{5}\\viewportasbutton\{/tmp/mobius\} \newline
\centerline{\\\viewportasbutton\{/tmp/mobius\}}\newline

This would create a picture of a viewport that is an active
button as well. Try it:

%%\space{5}\viewportasbutton{/tmp/mobius} \newline
%\space{5}\spadviewportasbutton{mobius} \newline
\centerline{\spadviewportasbutton{mobius}}\newline

{\bf Including Viewports Distributed with Axiom} \newline
All the above commands have counterparts that allow you to
access viewports that are already packaged with Axiom.
To include those viewports, just add on an "axiom" prefix
to the above commands: \newline

\centerline{\\\axiomviewport\{vA\} for \\\viewport\{vA\}}
\centerline{\\\axiomviewportbutton\{vB\} for \\\viewportbutton\{vB\}}
\centerline{\\\axiomviewportasbutton\{vC\} for \\\viewportasbutton\{vC\}}
\newline

All these macros really do is include some path that
indicates where Axiom stores the viewports.
\newline

Representations of A_6

— grpthry.ht —

```
\begin{page}{RepA6Page}{Representations of \texht{$A_6$}{A6}}
```

```

% author: J. Grabmeier, 08/08/89
\beginscroll
In what follows you'll see how to use Axiom to get all the irreducible
representations of the alternating group \texht{$A_6$}{A6} over the
field with two elements (GF 2). First, we generate \texht{$A_6$}{A6}
by a three-cycle: x = (1,2,3) and a 5-cycle: y = (2,3,4,5,6). Next we
have Axiom calculate the permutation representation over the integers
and over GF 2:
\spadpaste{genA6 : LIST PERM INT := [cycle [1,2,3],cycle [2,3,4,5,6]]
\bound{genA6}}
\spadpaste{pRA6 := permutationRepresentation (genA6, 6) \bound{pRA6}
\free{genA6}
}
Now we apply Parker's 'Meat-Axe' and split it:
\spadpaste{sp0 := meatAxe (pRA6::(LIST MATRIX PF 2)) \free{pRA6}
\bound{sp0}}
We have found the trivial module as a quotient module
and a 5-dimensional sub-module.
Try to split again:
\spadpaste{sp1 := meatAxe sp0.1 \bound{sp1}}
and we find a 4-dimensional sub-module and the trivial one again.
Now we can test if this representaton is absolutely irreducible:
\spadpaste{isAbsolutelyIrreducible? sp1.2 }
and we see that this 4-dimensional representation is absolutely
irreducible. So, we have found a second irreducible representation.
Now, we construct a representation by reducing an irreducible one of
the symmetric group S_6 over the integers mod 2. We take the one
labelled by the partition [2,2,1,1] and restrict it to
\texht{$A_6$}{A6}:
\spadpaste{d2211 := irreducibleRepresentation ([2,2,1,1],genA6)
\bound{d2211} }
Now split it:
\spadpaste{d2211m2 := d2211:: (LIST MATRIX PF 2);
sp2 := meatAxe d2211m2 \free{d2211}
\bound{sp2}}
This gave both a five and a four dimensional representation.
Now we take the 4-dimensional one
and we shall see that it is absolutely irreducible:
\spadpaste{isAbsolutelyIrreducible? sp2.1}
The two 4-dimensional representations are not equivalent:
\spadpaste{areEquivalent? (sp1.2, sp2.1)}
So we have found a third irreducible representation.
Now we construct a new representation using the tensor product
and try to split it:
\spadpaste{dA6d16 := tensorProduct(sp1.2,sp2.1);
meatAxe dA6d16 \bound{dA6d16}}
The representation is irreducible, but it may be not
absolutely irreducible.
\spadpaste{isAbsolutelyIrreducible? dA6d16}
So let's try the same procedure over the field with 4 elements:

```

```

\spadpaste{sp3 := meatAxe (dA6d16 :: (LIST MATRIX FF(2,2))) \bound{sp3}}
Now we find two 8-dimensional representations, dA6d8a and dA6d8b.
Both are absolutely irreducible...
\spadpaste{isAbsolutelyIrreducible? sp3.1}
\spadpaste{isAbsolutelyIrreducible? sp3.2}
and they are not equivalent:
\spadpaste{areEquivalent? (sp3.1,sp3.2)}
So we have found five absolutely irreducible representations
of \texht{$A_6$}{A6}
in characteristic 2.
General theory now tells us that there are no more irreducible ones.
Here, for future reference are all the absolutely irreducible 2-modular
representations of \texht{$A_6$}{A6}
\spadpaste{sp0.2 \free{sp0}}
\spadpaste{sp1.2 \free{sp1}}
\spadpaste{sp2.1 \free{sp2}}
\spadpaste{sp3.1 \free{sp3}}
\spadpaste{sp3.2 \free{sp3}}
And here again is the irreducible, but not absolutely irreducible
representations of \texht{$A_6$}{A6} over GF 2
\spadpaste{dA6d16 \free{dA6d16}}
\endscroll

Representation Theory

— grpthy.ht —

```

\begin{page}{InfoRepTheoryPage}{Representation Theory}
\beginscroll
\horizontalline
Representation theory for finite groups studies finite groups by
embedding them in a general linear group over a field or an integral
domain. Hence, we are representing each element of the group by an
invertible matrix. Two matrix representations of a given group are
equivalent, if, by changing the basis of the underlying space, you can
go from one to the other. When you change bases, you transform the
matrices that are the images of elements by conjugating them by an
invertible matrix.
\newline
\newline
If we can find a subspace which is fixed under the image of the group,
then there exists a 'base change' after which all the representing
matrices are in upper triangular block form. The block matrices on
the main diagonal give a new representation of the group of lower
degree. Such a representation is said to be 'reducible'.

Group Theory

```

\begin{page}{InfoGroupTheoryPage}{Group Theory}
%%
%% Johannes Grabmeier 03/02/90
%%
\beginscroll
A {\it group} is a set  $G$  together with an associative operation  $*$ 
satisfying the axioms of existence of a unit element and an inverse of
every element of the group. The Axiom category \spadtype{Group}
represents this setting. Many data structures in Axiom are groups and
therefore there is a large variety of examples as fields and
polynomials, although the main interest there is not the group
structure.

To work with and in groups in a concrete manner some way of
representing groups has to be chosen. A group can be given as a list
of generators and a set of relations. If there are no relations, then
we have a {\it free group}, realized in the domain
\spadtype{FreeMonoid} which won't be discussed here. We consider {\it
permutation groups}, where a group is realized as a subgroup of the
symmetric group of a set, i.e. the group of all bijections of a set,
the operation being the composition of maps. Indeed, every group can
be realized this way, although this may not be practical.

Furthermore group elements can be given as invertible matrices. The
group operation is reflected by matrix multiplication. More precise
in representation theory group homomorphisms from a group to general
linear groups are constructed. Some algorithms are implemented in
Axiom.

GeneralSparseTable

⇒ “notitle” (TableXmpPage) [3.106](#) on page [1298](#)

— gstbl.ht —

```
\begin{page}{GeneralSparseTableXmpPage}{GeneralSparseTable}
\beginscroll
```

Sometimes when working with tables there is a natural value to use as the entry in all but a few cases. The `\spadtype{GeneralSparseTable}` constructor can be used to provide any table type with a default value for entries. See `\downlink{‘Table’}{TableXmpPage}\ignore{Table}` for general information about tables.

```
\showBlurb{GeneralSparseTable}
```

Suppose we launched a fund-raising campaign to raise fifty thousand dollars. To record the contributions, we want a table with strings as keys (for the names) and integer entries (for the amount). In a data base of cash contributions, unless someone has been explicitly entered, it is reasonable to assume they have made a zero dollar contribution.

```
\xctc{
This creates a keyed access file with default entry \spad{0}.
}{
\spadpaste{patrons: GeneralSparseTable(String, Integer,
KeyedAccessFile(Integer), 0) := table() ; \bound{patrons}}
}
\xctc{
Now \spad{patrons} can be used just as any other table.
Here we record two gifts.
}{
\spadpaste{patrons."Smith" := 10500 \free{patrons}\bound{smith}}
}
\xctc{
}{
\spadpaste{patrons."Jones" := 22000 \free{smith}\bound{jones}}
}
\xctc{
Now let us look up the size of the contributions from Jones and Stingy.
}{
\spadpaste{patrons."Jones" \free{jones}}
}
\xctc{
}{
\spadpaste{patrons."Stingy" \free{jones}}
}
```

```

\xtc{
Have we met our seventy thousand dollar goal?
}{
\spadpaste{reduce(+, entries patrons) \free{jones}}
}
\noOutputXtc{
So the project is cancelled and we can delete the data base:
}{
\spadpaste{)system rm -r kaf*.sdata \free{patrons}}

\spadpaste{x >= 1 \free{x}}
}
```

```
\xctc{
```

```
{
```

```
\spadpaste{positive?(x) \free{x}}
}
```

```
\xctc{
```

This is the recommended way of determining whether an integer is zero.

```
{
\spadpaste{zero?(x) \free{x}}
}
```

```
\beginImportant
```

Use the `\spadfunFrom{zero?}{Integer}` operation whenever you are testing any mathematical object for equality with zero. This is usually more efficient than using `\spadop{=}` (think of matrices: it is easier to tell if a matrix is zero by just checking term by term than constructing another “zero” matrix and comparing the two matrices

term by term) and also avoids the problem that `\spadop{=}` is usually used for creating equations.

`\endImportant`

`\xctc{`

This is the recommended way of determining whether an integer is equal to one.

`}{`

`\spadpaste{one?(x) \free{x}}`

`}`

`\xctc{`

This syntax is used to test equality using `\spadopFrom{=}{Integer}`.

It says that you want a `\spadtype{Boolean}` (`\spad{true}` or

`\spad{false}`) answer rather than an equation.

`}{`

`\spadpaste{(x = -101)@Boolean \free{x}}`

`}`

`\xctc{`

The operations `\spadfunFrom{odd?}{Integer}` and

`\spadfunFrom{even?}{Integer}` determine whether an integer is odd or even, respectively. They each return a `\spadtype{Boolean}` object.

`}{`

`\spadpaste{odd?(x) \free{x}}`

`}`

`\xctc{`

`}{`

`\spadpaste{even?(x) \free{x}}`

`}`

`\xctc{`

The operation `\spadfunFrom{gcd}{Integer}` computes the greatest common divisor of two integers.

`}{`

`\spadpaste{gcd(56788,43688)}`

`}`

`\xctc{`

The operation

`\spadfunFrom{lcm}{Integer}` computes their least common multiple.

`}{`

`\spadpaste{lcm(56788,43688)}`

`}`

`\xctc{`

To determine the maximum of two integers, use `\spadfunFrom{max}{Integer}`.

`}{`

`\spadpaste{max(678,567)}`

`}`

`\xctc{`

To determine the minimum, use `\spadfunFrom{min}{Integer}`.

`}{`

```
\spadpaste{min(678,567)}
}
```

```
\xctc{
The \spadfun{reduce} operation is used to extend
binary operations to more than two arguments.
For example, you can use \spadfun{reduce} to find the maximum integer in
a list or compute the least common multiple of all integers in the list.
```

```
}{
\spadpaste{reduce(max,[2,45,-89,78,100,-45])}
}
```

```
\xctc{
}{
\spadpaste{reduce(min,[2,45,-89,78,100,-45])}
}
```

```
\xctc{
}{
\spadpaste{reduce(gcd,[2,45,-89,78,100,-45])}
}
```

```
\xctc{
}{
\spadpaste{reduce(lcm,[2,45,-89,78,100,-45])}
}
```

```
\xctc{
The infix operator “/” is {\it not} used to compute the quotient
of integers.
```

```
Rather, it is used to create rational numbers as described in
\downlink{‘Fraction’}{FractionXmpPage}\ignore{Fraction}.
```

```
}{
\spadpaste{13 / 4}
}
```

```
\xctc{
The infix operation \spadfunFrom{quo}{Integer} computes the integer
quotient.
```

```
}{
\spadpaste{13 quo 4}
}
```

```
\xctc{
The infix operation \spadfunFrom{rem}{Integer} computes the integer
remainder.
```

```
}{
\spadpaste{13 rem 4}
}
```

```
\xctc{
One integer is evenly divisible by another if the remainder is zero.
The operation \spadfunFrom{exquo}{Integer} can also be used.
See \downlink{‘‘Unions’’}{ugTypesUnionsPage} in Section 2.5
\ignore{ugTypesUnions} for an example.
```

```
}{
```

```

\spadpaste{zero?(167604736446952 rem 2003644)}
}

\xtc{
The operation \spadfunFrom{divide}{Integer} returns a record of the
quotient and remainder and thus is more efficient when both are needed.
}{
\spadpaste{d := divide(13,4) \bound{d}}
}
\xtc{
}{
\spadpaste{d.quotient \free{d}}
}
\xtc{
Records are discussed in detail in
\downlink{'Records'}{ugTypesRecordsPage} in Section 2.4
\ignore{ugTypesRecords}.

 ⇐ “Some Number Theoretic Functions” (ugxIntegerNTPage) [3.55](#) on page [716](#)
 — intheory.ht —

```

\begin{page}{IntNumberTheoryFnsXmpPage}
{IntegerNumberTheoryFunctions}
\beginscroll

```

The `\spadtype{IntegerNumberTheoryFunctions}` package contains a variety of operations of interest to number theorists. Many of these operations deal with divisibility properties of integers. (Recall that an integer `\spad{a}` divides an integer `\spad{b}` if there is an integer `\spad{c}` such that `\spad{b = a * c}`.)

```

\xtc{
The operation \spadfunFrom{divisors}{IntegerNumberTheoryFunctions}
returns a list of the divisors of an integer.
}{
\spadpaste{div144 := divisors(144) \bound{div144}}
}
\xtc{
You can now compute the number of divisors of \spad{144} and the sum of

```

the divisors of `\spad{144}` by counting and summing the elements of the list we just created.

```
{
\spadpaste{\#(div144) \free{div144}}
}
\xtc{
}{
\spadpaste{reduce(+,div144) \free{div144}}
}
```

Of course, you can compute the number of divisors of an integer `\spad{n}`, usually denoted `\spad{d(n)}`, and the sum of the divisors of an integer `\spad{n}`, usually denoted `\spad{\texht{σ}{sigma}(n)}`, without ever listing the divisors of `\spad{n}`.

```
\xtc{
In Axiom, you can simply call the operations
\spadfunFrom{numberOfDivisors}{IntegerNumberTheoryFunctions} and
\spadfunFrom{sumOfDivisors}{IntegerNumberTheoryFunctions}.
}{
\spadpaste{numberOfDivisors(144)}
}
\xtc{
}{
\spadpaste{sumOfDivisors(144)}
}
```

The key is that `\spad{d(n)}` and `\spad{\texht{σ}{sigma}(n)}` are ‘multiplicative functions.’

This means that when `\spad{n}` and `\spad{m}` are relatively prime, that is, when

`\spad{n}` and `\spad{m}` have no prime factor in common, then

`\spad{d(nm)} = d(n) d(m)` and

`\spad{\texht{σ}{sigma}(nm)} = \texht{σ}{sigma}(n) \texht{σ}{sigma}(m).`

Note that these functions are trivial to compute when `\spad{n}` is a prime power and are computed for general `\spad{n}` from the prime factorization of `\spad{n}`.

Other examples of multiplicative functions are

`\spad{\texht{σ_k}{sigma_k}(n)}`, the sum of the `\eth{\spad{k}}` powers of the divisors of `\spad{n}` and

`\texht{$\varphi(n)$}{\spad{phi}(n)}`, the

number of integers between 1 and `\spad{n}` which are prime to `\spad{n}`.

The corresponding Axiom operations are called

```
\spadfunFrom{sumOfKthPowerDivisors}{IntegerNumberTheoryFunctions} and
\spadfunFrom{eulerPhi}{IntegerNumberTheoryFunctions}.
```

An interesting function is `\spad{\texht{μ}{mu}(n)}`, the `\texht{M}{o}bius μ` function, defined

as follows:

$\mu(1) = 1$, $\mu(n) = 0$,
when n is divisible by a
square, and
 $\mu(n) = (-1)^k$, when n
is the product of k distinct primes.
The corresponding Axiom operation is
`\spadfunFrom{moebiusMu}{IntegerNumberTheoryFunctions}.`
This function occurs in the following theorem:

```
\noindent
{\bf Theorem} (\texht{M\"{o}bius}{Möbius} Inversion Formula): \newline
%\texht{\begin{quotation}\noindent}{\newline\indent{5}}
Let  $\mu$  be a function on the positive integers and let  $F(n)$ 
be defined by

$$F(n) = \sum_{d|n} f(d)$$

sum of  $f(d)$  over  $d|n$ 
where the sum is taken over the positive divisors of  $n$ .
Then the values of  $f(n)$  can be recovered from the values of
 $F(n)$ :

$$f(n) = \sum_{d|n} \mu(d) F(n/d)$$

sum of  $\mu(d) F(n/d)$  over  $d|n$ ,
where again the sum is taken over the positive divisors of  $n$ .
```

```
\xctc{
When  $\mu(1) = 1$ , then  $F(n) = n$ .
Thus, if you sum  $\mu(d) \cdot d(n/d)$ 
over the positive divisors
 $d$  of  $n$ , you should always get  $1$ .
}{
\spadpaste{f1(n) == reduce(+,[moebiusMu(d) * numberOfDivisors(quo(n,d))
for d in divisors(n)]) \bound{f1}}
}
\xctc{
}{
\spadpaste{f1(200) \free{f1}}
}
\xctc{
}{
\spadpaste{f1(846) \free{f1}}
}
\xctc{
Similarly,
when  $\mu(n) = n$ , then  $F(n) = \sigma(n)$ .
Thus, if you sum  $\mu(d) \cdot \sigma(n/d)$ 
over the positive divisors
 $d$  of  $n$ , you should always get  $n$ .
}{
\spadpaste{f2(n) == reduce(+,[moebiusMu(d) * sumOfDivisors(quo(n,d))
```

```

for d in divisors(n)) \bound{f2}}
}
\xtc{
}{
\spadpaste{f2(200) \free{f2}}
}
\xtc{
}{
\spadpaste{f2(846) \free{f2}}
}

```

The Fibonacci numbers are defined by $\text{\spad}\{F(1) = F(2) = 1\}$ and $\text{\spad}\{F(n) = F(n-1) + F(n-2)\}$ for $\text{\spad}\{n = 3, 4, \dots\}$.

```

\xtc{
The operation \spadfunFrom{fibonacci}{IntegerNumberTheoryFunctions}
computes the \eth{\spad{n}} Fibonacci number.
}{
\spadpaste{fibonacci(25)}
}
\xtc{
}{
\spadpaste{[fibonacci(n) for n in 1..15]}
}
\xtc{
Fibonacci numbers can also be expressed as sums of binomial coefficients.
}{
\spadpaste{fib(n) == reduce(+,[binomial(n-1-k,k)
for k in 0..quo(n-1,2)]) \bound{fib}}
}
\xtc{
}{
\spadpaste{fib(25) \free{fib}}
}
\xtc{
}{
\spadpaste{[fib(n) for n in 1..15] \free{fib}}
}

```

Quadratic symbols can be computed with the operations $\text{\spadfunFrom}\{\text{legendre}\}\{\text{IntegerNumberTheoryFunctions}\}$ and $\text{\spadfunFrom}\{\text{jacobi}\}\{\text{IntegerNumberTheoryFunctions}\}$.

The Legendre symbol

$\text{\texht}\{\$\left(\{a \over p\}\right)\$\}\{\text{\spad}\{(a/p)\}\}$

is defined for integers $\text{\spad}\{a\}$ and

$\text{\spad}\{p\}$ with $\text{\spad}\{p\}$ an odd prime number.

By definition, $\text{\texht}\{\$\left(\{a \over p\}\right)\$\}\{\text{\spad}\{(a/p) = +1\}\}$,

when $\text{\spad}\{a\}$ is a square $\text{\spad}\{(\text{mod } p)\}$,

$\text{\texht}\{\$\left(\{a \over p\}\right)\$\}\{\text{\spad}\{(a/p) = -1\}\}$,

when $\text{\spad}\{a\}$ is not a square $\text{\spad}\{(\text{mod } p)\}$, and

```

\texht{\left({a \over p}\right)}{\spad{(a/p) = 0}},
when \spad{a} is divisible by \spad{p}.
\xtc{
You compute \texht{\left({a \over p}\right)}{\spad{(a/p)}}
via the command \spad{legendre(a,p)}.
}{
\spadpaste{legendre(3,5)}
}
\xtc{
}{
\spadpaste{legendre(23,691)}
}
The Jacobi symbol \texht{\left({a \over n}\right)}{\spad{(a/n)}}
is the usual extension of the Legendre
symbol, where \spad{n} is an arbitrary integer.
The most important property of the Jacobi symbol is the following:
if \spad{K} is a quadratic field with discriminant \spad{d} and quadratic
character \texht{\chi}{\spad{chi}},
then \texht{\chi}{\spad{chi}}\spad{(n) = (d/n)}.
Thus, you can use the Jacobi symbol
to compute, say, the class numbers of
imaginary quadratic fields from a standard class number formula.
\xtc{
This function computes the class number of the imaginary
quadratic field with discriminant \spad{d}.
}{
\spadpaste{h(d) == quo(reduce(+, [jacobi(d,k) for k in 1..quo(-d, 2)]),
2 - jacobi(d,2)) \bound{h}}
}
\xtc{
}{
\spadpaste{h(-163) \free{h}}
}
\xtc{
}{
\spadpaste{h(-499) \free{h}}
}
\xtc{
}{
\spadpaste{h(-1832) \free{h}}
}

```

The domain `\spadtype{KeyedAccessFile(S)}` provides files which can be used as associative tables. Data values are stored in these files and can be retrieved according to their keys. The keys must be strings so this type behaves very much like the `\spadtype{StringTable(S)}` domain. The difference is that keyed access files reside in secondary storage while string tables are kept in memory. For more information on table-oriented operations, see the description of `\spadtype{Table}`.

```
\xtc{
Before a keyed access file can be used, it must first be opened.
A new file can be created by opening it for output.
}{
\spadpaste{ey: KeyedAccessFile(Integer) :=
open("/tmp/editor.year", "output") \bound{ey}}
}
\xtc{
Just as for vectors, tables or lists, values are saved in a keyed
access file by setting elements.
}{
\spadpaste{ey."Char"      := 1986 \free{ey}\bound{eya}}
}
\xtc{
}{
\spadpaste{ey."Caviness" := 1985 \free{ey}\bound{eyb}}
}
\xtc{
}{
\spadpaste{ey."Fitch"    := 1984 \free{ey}\bound{eyc}}
}
\xtc{
Values are retrieved using application, in any of its syntactic forms.
}{
\spadpaste{ey."Char"      \free{eya}}
}
\xtc{
}{
```

```

\spadpaste{ey("Char")    \free{eya}}
}
\xtc{
}{
\spadpaste{ey "Char"    \free{eya}}
}
\xtc{
Attempting to retrieve a non-existent element in this way causes an
error.  If it is not known whether a key exists, you should use the
\spadfunFrom{search}{KeyedAccessFile} operation.
}{
\spadpaste{search("Char", ey)    \free{eya,eyb,eyc}\bound{eyaa}}
}
\xtc{
}{
\spadpaste{search("Smith", ey) \free{eyaa}}
}
\xtc{
When an entry is no longer needed, it can be removed from the file.
}{
\spadpaste{remove!("Char", ey) \free{eyaa}\bound{eybb}}
}
\xtc{
The \spadfunFrom{keys}{KeyedAccessFile} operation returns a list of
all the keys for a given file.
}{
\spadpaste{keys ey \free{eybb}}
}
\xtc{
The \spadfunFrom{\#}{KeyedAccessFile} operation gives the
number of entries.
}{
\spadpaste{\#ey    \free{eybb}}
}

```

The table view of keyed access files provides safe operations. That is, if the Axiom program is terminated between file operations, the file is left in a consistent, current state. This means, however, that the operations are somewhat costly. For example, after each update the file is closed.

```

\xtc{
Here we add several more items to the file, then check its contents.
}{
\spadpaste{KE := Record(key: String, entry: Integer) \bound{KE}}
}
\xtc{
}{
\spadpaste{reopen!(ey, "output") \free{eybb,KE}\bound{eycc}}
}
\xtc{

```

If many items are to be added to a file at the same time, then it is more efficient to use the

```
\spadfunFromX{write}{KeyedAccessFile} operation.
}{
\spadpaste{write!(ey, ["van Hulzen", 1983]\$KE) \bound{eyccA}\free{eycc}}
}
\xtc{
}{
\spadpaste{write!(ey, ["Calmet", 1982]\$KE) \bound{eyccB}\free{eycc}}
}
\xtc{
}{
\spadpaste{write!(ey, ["Wang", 1981]\$KE) \bound{eyccC}\free{eycc}}
}
\xtc{
}{
\spadpaste{close! ey \free{eyccA,eyccB,eyccC}\bound{eydd}}
}
\xtc{
The \spadfunFromX{read}{KeyedAccessFile} operation is also available
from the file view, but it returns elements in a random order. It is
generally clearer and more efficient to use the
\spadfunFrom{keys}{KeyedAccessFile} operation and to extract elements
by key.
}{
\spadpaste{keys ey \free{eydd}}
}
\xtc{
}{
\spadpaste{members ey \free{eydd}}
}
\noOutputXtc{
}{
\spadpaste{)system rm -r /tmp/editor.year \free{ey}}
}
}
```

3.58 kernel.ht

Kernel

⇒ “notitle” (BasicOperatorXmpPage) [3.10](#) on page [169](#)

⇒ “notitle” (ExpressionXmpPage) [3.33](#) on page [436](#)

— **kernel.ht** —

```

\begin{page}{KernelXmpPage}{Kernel}
\beginscroll

```

A {\it kernel} is a symbolic function application (such as

`\spad{sin(x + y)}` or a symbol (such as `\spad{x}`).
 More precisely, a non-symbol
 kernel over a set `{\it S}` is an operator applied to a given list of
 arguments from `{\it S}`. The operator has type
`\axiomType{BasicOperator}` (see
`\downlink{‘BasicOperator’}{BasicOperatorXmpPage}\ignore{BasicOperator}`)
 and the kernel object is usually part of an expression object (see
`\downlink{‘Expression’}{ExpressionXmpPage}\ignore{Expression}`).

Kernels are created implicitly for you when you
 create expressions.

```
\xtc{
}{
\spadpaste{x :: Expression Integer}
}
```

```
\xtc{
You can directly create a ‘symbol’ kernel by using the
\axiomFunFrom{kernel}{Kernel} operation.
```

```
{
\spadpaste{kernel x}
}
\xtc{
This expression has two different kernels.
}{
\spadpaste{sin(x) + cos(x) \bound{sincos}}
}
```

```
\xtc{
The operator \axiomFunFrom{kernels}{Expression} returns a list
of the kernels in an object of type \axiomType{Expression}.
```

```
{
\spadpaste{kernels \% \free{sincos}}
}
```

```
\xtc{
This expression also has two different kernels.
}{
\spadpaste{sin(x)**2 + sin(x) + cos(x) \bound{sincos2}}
}
```

```
\xtc{
The \spad{sin(x)} kernel is used twice.
```

```
{
\spadpaste{kernels \% \free{sincos2}}
}
```

```
\xtc{
An expression need not contain any kernels.
```

```
{
\spadpaste{kernels(1 :: Expression Integer)}
}
```

```
\xtc{
If one or more kernels are present, one of them is
designated the {\it main} kernel.
```

```

}{
\spadpaste{mainKernel(cos(x) + tan(x))}
}
\xtc{
Kernels can be nested. Use \axiomFunFrom{height}{Kernel} to determine
the nesting depth.
}{
\spadpaste{height kernel x}
}
\xtc{
This has height 2 because the \spad{x} has height 1 and then we apply
an operator to that.
}{
\spadpaste{height mainKernel(sin x)}
}
\xtc{
}{
\spadpaste{height mainKernel(sin cos x)}
}
\xtc{
}{
\spadpaste{height mainKernel(sin cos (tan x + sin x))}
}
\xtc{
Use the \axiomFunFrom{operator}{Kernel} operation to extract the
operator component of the kernel.
The operator has type \axiomType{BasicOperator}.
}{
\spadpaste{operator mainKernel(sin cos (tan x + sin x))}
}
\xtc{
Use the \axiomFunFrom{name}{Kernel} operation to extract the name of
the operator component of the kernel. The name has type
\axiomType{Symbol}. This is really just a shortcut for a two-step
process of extracting the operator and then calling
\axiomFunFrom{name}{BasicOperator} on the operator.
}{
\spadpaste{name mainKernel(sin cos (tan x + sin x))}
}
Axiom knows about functions such as \axiomFun{sin}, \axiomFun{cos}
and so on and can make kernels and then expressions using them.
To create a kernel and expression using an arbitrary operator, use
\axiomFunFrom{operator}{BasicOperator}.
\xtc{
Now \spad{f} can be used to create symbolic function applications.
}{
\spadpaste{f := operator 'f \bound{f}}
}
\xtc{
}{

```

```

\spadpaste{e := f(x, y, 10) \free{f}\bound{e}}
}
\xtc{
Use the \axiomFunFrom{is?}{Kernel} operation to learn if the
operator component of a kernel is equal to a given operator.
}{
\spadpaste{is?(e, f) \free{f e}}
}
\xtc{
You can also use a symbol or a string as the second
argument to \axiomFunFrom{is?}{Kernel}.
}{
\spadpaste{is?(e, 'f) \free{e}}
}
\xtc{
Use the \axiomFunFrom{argument}{Kernel} operation to get a list containing
the argument component of a kernel.
}{
\spadpaste{argument mainKernel e \free{f}\free{e}}
}

```

Conceptually, an object of type `\axiomType{Expression}` can be thought of a quotient of multivariate polynomials, where the ‘‘variables’’ are kernels.

The arguments of the kernels are again expressions and so the structure recurses.

See

`\downlink{‘Expression’}{ExpressionXmpPage}\ignore{Expression}`
for examples of using kernels to
take apart expression objects.

LazardSetSolvingPackage

```
\begin{page}{LazardSetSolvingPackageXmpPage}{LazardSetSolvingPackage}
\beginscroll
```

The `\spadtype{LazardSetSolvingPackage}` package constructor solves polynomial systems by means of Lazard triangular sets. However one condition is relaxed: Regular triangular sets whose saturated ideals have positive dimension are not necessarily normalized.

The decompositions are computed in two steps. First the algorithm of Moreno Maza (implemented in the `\spadtype{RegularTriangularSet}` domain constructor) is called. Then the resulting decompositions are converted into lists of square-free regular triangular sets and the redundant components are removed. Moreover, zero-dimensional regular triangular sets are normalized.

Note that the way of understanding triangular decompositions is detailed in the example of the `\spadtype{RegularTriangularSet}` constructor.

The `\spadtype{LazardSetSolvingPackage}` constructor takes six arguments. The first one, `{\bf R}`, is the coefficient ring of the polynomials; it must belong to the category `\spadtype{GcdDomain}`. The second one, `{\bf E}`, is the exponent monoid of the polynomials; it must belong to the category `\spadtype{OrderedAbelianMonoidSup}`. the third one, `{\bf V}`, is the ordered set of variables; it must belong to the category `\spadtype{OrderedSet}`. The fourth one is the polynomial ring; it must belong to the category `\spadtype{RecursivePolynomialCategory(R,E,V)}`. The fifth one is a domain of the category `\spadtype{RegularTriangularSetCategory(R,E,V,P)}` and the last one is a domain of the category `\spadtype{SquareFreeRegularTriangularSetCategory(R,E,V,P)}`. The abbreviation for `\spadtype{LazardSetSolvingPackage}` is `\spad{LAZM3PK}`.

N.B. For the purpose of solving zero-dimensional algebraic systems, see also `\spadtype{LexTriangularPackage}` and `\spadtype{ZeroDimensionalSolvePackage}`. These packages are easier to call than `\spad{LAZM3PK}`. Moreover, the `\spadtype{ZeroDimensionalSolvePackage}` package provides operations to compute either the complex roots or the real roots.

We illustrate now the use of the `\spadtype{LazardSetSolvingPackage}` package constructor with two examples (Butcher and Vermeer).

```
\xctc{
Define the coefficient ring.
}{
```

```
\spadpaste{R := Integer \bound{R}}
}
```

```
\xctc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [b1,x,y,z,t,v,u,w] \bound{ls}}
}
```

```
\xctc{
and make it an ordered set;
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
```

```
\xctc{
then define the exponent monoid.
}{
\spadpaste{E := IndexedExponents V \free{V} \bound{E}}
}
```

```
\xctc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
```

```
\xctc{
Let the variables be polynomial.
}{
\spadpaste{b1: P := 'b1 \free{P} \bound{b1}}
}
```

```
\xctc{
}{
\spadpaste{x: P := 'x \free{P} \bound{x}}
}
```

```
\xctc{
}{
\spadpaste{y: P := 'y \free{P} \bound{y}}
}
```

```
\xctc{
}{
\spadpaste{z: P := 'z \free{P} \bound{z}}
}
```

```
\xctc{
}{
\spadpaste{t: P := 't \free{P} \bound{t}}
}
```

```
\xctc{
```

```

}{
\spadpaste{u: P := 'u \free{P} \bound{u}}
}
\xtc{
}{
\spadpaste{v: P := 'v \free{P} \bound{v}}
}
\xtc{
}{
\spadpaste{w: P := 'w \free{P} \bound{w}}
}

\xtc{
Now call the \spadtype{RegularTriangularSet} domain constructor.
}{
\spadpaste{T := REGSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{T} }
}

\xtc{
Define a polynomial system (the Butcher example).
}{
\spadpaste{p0 := b1 + y + z - t - w \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p0}}
}
\xtc{
}{
\spadpaste{p1 := 2*z*u + 2*y*v + 2*t*w - 2*w**2 - w - 1 \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w} \bound{p1}}
}
\xtc{
}{
\spadpaste{p2 := 3*z*u**2 + 3*y*v**2 - 3*t*w**2 + 3*w**3 +
3*w**2 - t + 4*w \free{b1} \free{x} \free{y} \free{z} \free{t}
\free{u} \free{v} \free{w} \bound{p2}}
}
\xtc{
}{
\spadpaste{p3 := 6*x*z*v - 6*t*w**2 + 6*w**3 - 3*t*w +
6*w**2 - t + 4*w \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{p3}}
}
\xtc{
}{
\spadpaste{p4 := 4*z*u**3+ 4*y*v**3+ 4*t*w**3- 4*w**4 -
6*w**3+ 4*t*w- 10*w**2- w- 1 \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p4}}
}
\xtc{
}{

```

```

\spadpaste{p5 := 8*x*z*u*v + 8*t*w**3 - 8*w**4 + 4*t*w**2 -
12*w**3 + 4*t*w - 14*w**2 - 3*w - 1 \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p5}}
}
\xtc{
}{
\spadpaste{p6 := 12*x*z*v**2 + 12*t*w**3 - 12*w**4 + 12*t*w**2 -
18*w**3 + 8*t*w - 14*w**2 - w - 1 \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p6}}
}
\xtc{
}{
\spadpaste{p7 := -24*t*w**3 + 24*w**4 - 24*t*w**2 + 36*w**3 -
8*t*w + 26*w**2 + 7*w + 1 \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{p7}}
}
\xtc{
}{
\spadpaste{lp := [p0, p1, p2, p3, p4, p5, p6, p7] \free{p0}
\free{p1} \free{p2} \free{p3} \free{p4} \free{p5} \free{p6}
\free{p7} \bound{lp}}
}

\xtc{
First of all, let us solve this system in the sense of Lazard
by means of the \spadtype{REGSET} constructor:
}{
\spadpaste{lhs := zeroSetSplit(lp, false) $T \free{lp} \free{T} \bound{lhs}}
}

\xtc{
We can get the dimensions of each component
of a decomposition as follows.
}{
\spadpaste{[coHeight(ts) for ts in lhs] \free{lhs}}
}

The first five sets have a simple shape.
However, the last one, which has dimension zero, can be simplified
by using Lazard triangular sets.

\xtc{
Thus we call the \spadtype{SquareFreeRegularTriangularSet} domain
constructor,
}{
\spadpaste{ST := SREGSET(R, E, V, P) \free{R} \free{E} \free{V}
\free{P} \bound{ST} }
}

\xtc{

```

and set the \spadtype{LAZM3PK} package constructor to our situation.

```
{
\spadpaste{pack := LAZM3PK(R,E,V,P,T,ST) \free{R} \free{E}
\free{V} \free{P} \free{T} \free{ST} \bound{pack} }
}
```

```
\xtc{
```

We are ready to solve the system by means of Lazard triangular sets:

```
{
\spadpaste{zeroSetSplit(lp,false)$pack \free{lp} \free{pack}}
}
```

We see the sixth triangular set is {\em nicer} now:
each one of its polynomials has a constant initial.

We follow with the Vermeer example. The ordering is the usual one
for this system.

```
\xtc{
```

Define the polynomial system.

```
{
\spadpaste{f0 := (w - v) ** 2 + (u - t) ** 2 - 1 \free{b1} \free{x}
\free{y} \free{z} \free{t} \free{u} \free{v} \free{w} \bound{f0}}
}
\xtc{
}{
\spadpaste{f1 := t ** 2 - v ** 3 \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{f1}}
}
\xtc{
}{
\spadpaste{f2 := 2 * t * (w - v) + 3 * v ** 2 * (u - t) \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w}
\bound{f2}}
}
\xtc{
}{
\spadpaste{f3 := (3 * z * v ** 2 - 1) * (2 * z * t - 1) \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w}
\bound{f3}}
}
\xtc{
}{
\spadpaste{lf := [f0, f1, f2, f3] \free{f0} \free{f1} \free{f2}
\free{f3} \bound{lf}}
}
}
```

```
\xtc{
```

First of all, let us solve this system in the sense of Kalkbrener by

```

means of the \spadtype{REGSET}
constructor:
}{
\spadpaste{zeroSetSplit(lf,true)$T \free{lf} \free{T}}
}

```

We have obtained one regular chain (i.e. regular triangular set) with dimension 1. This set is in fact a characteristic set of the (radical of) the ideal generated by the input system $\{\mathbf{lf}\}$. Thus we have only the $\{\text{generic points}\}$ of the variety associated with $\{\mathbf{lf}\}$ (for the elimination ordering given by $\{\mathbf{ls}\}$).

So let us get now a full description of this variety.

```

\xtc{
Hence, we solve this system in the sense of Lazard by means of the
\spadtype{REGSET}
constructor:
}{
\spadpaste{zeroSetSplit(lf,false)$T \free{lf} \free{T}}
}

```

We retrieve our regular chain of dimension 1 and we get three regular chains of dimension 0 corresponding to the $\{\text{degenerated cases}\}$. We want now to simplify these zero-dimensional regular chains by using Lazard triangular sets. Moreover, this will allow us to prove that the above decomposition has no redundant component. $\{\text{N.B.}\}$ Generally, decompositions computed by the $\text{\spadtype{REGSET}}$ constructor do not have redundant components. However, to be sure that no redundant component occurs one needs to use the $\text{\spadtype{SREGSET}}$ or $\text{\spadtype{LAZM3PK}}$ constructors.

```

\xtc{
So let us solve the input system in the sense of Lazard by means of
the \spadtype{LAZM3PK} constructor:
}{
\spadpaste{zeroSetSplit(lf,false)$pack \free{lf} \free{pack}}
}

```

Due to square-free factorization, we obtained now four zero-dimensional regular chains. Moreover, each of them is normalized (the initials are constant). Note that these zero-dimensional components may be investigated further with the $\text{\spadtype{ZeroDimensionalSolvePackage}}$ package constructor.

LexTriangularPackage

— lextripk.ht —

```

\begin{page}{LexTriangularPkgXmpPage}{LexTriangularPackage}
\begin{scroll}
The \spadtype{LexTriangularPackage} package constructor provides
an implementation of the {\em lexTriangular} algorithm
(D. Lazard "Solving Zero-dimensional Algebraic Systems",
J. of Symbol. Comput., 1992).
This algorithm decomposes a zero-dimensional variety into zero-sets of
regular triangular sets. Thus the input system must have a finite
number of complex solutions. Moreover, this system needs to be a
lexicographical Groebner basis.

```

This package takes two arguments: the coefficient-ring $\{\mathbf{R}\}$ of the polynomials, which must be a `\spadtype{GcdDomain}` and their set of variables given by $\{\mathbf{ls}\}$ a `\spadtype{List Symbol}`. The type of the input polynomials must be `\spadtype{NewSparseMultivariatePolynomial(R,V)}` where $\{\mathbf{V}\}$ is `\spadtype{OrderedVariableList(ls)}`. The abbreviation for `\spadtype{LexTriangularPackage}` is `\spadtype{LEXTRIPK}`. The main operations are `\axiomOpFrom{lexTriangular}{LexTriangularPackage}` and `\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}`. The later provide decompositions by means of square-free regular triangular sets, built with the `\spadtype{SREGSET}` constructor, whereas the former uses the `\spadtype{REGSET}` constructor. Note that these constructors also implement another algorithm for solving algebraic systems by means of regular triangular sets; in that case no computations of Groebner bases are needed and the input system may have any dimension (i.e. it may have an infinite number of solutions).

The implementation of the `\em lexTriangular` algorithm provided in the `\spadtype{LexTriangularPackage}` constructor differs from that reported in "Computations of gcd over algebraic towers of simple extensions" by M. Moreno Maza and R. Rioboo (in proceedings of AAEC11, Paris, 1995). Indeed, the `\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}` operation removes all multiplicities of the solutions (i.e. the computed solutions are pairwise different) and the `\axiomOpFrom{lexTriangular}{LexTriangularPackage}` operation may keep some multiplicities; this latter operation runs generally faster than the former.

The interest of the `\em lexTriangular` algorithm is due to the following experimental remark. For some examples, a triangular decomposition of a zero-dimensional variety can be computed faster via a lexicographical Groebner basis computation than by using a direct method (like that of `\spadtype{SREGSET}` and `\spadtype{REGSET}`). This happens typically when the total degree of the system relies essentially on its smallest variable (like in the `\em Katsura` systems). When this is not the case, the direct method may give better timings (like in the `\em Rose` system).

Of course, the direct method can also be applied to a lexicographical Groebner basis. However, the `\em lexTriangular` algorithm takes advantage of the structure of this basis and avoids many unnecessary computations which are performed by the direct method.

For this purpose of solving algebraic systems with a finite number of solutions, see also the `\spadtype{ZeroDimensionalSolvePackage}`. It allows to use both strategies (the `lexTriangular` algorithm and the direct method) for computing either the complex or real roots of a system.

Note that the way of understanding triangular decompositions is detailed in the example of the `\spadtype{RegularTriangularSet}` constructor.

Since the `\spadtype{LEXTRIPK}` package constructor is limited to zero-dimensional systems, it provides a `\axiomOpFrom{zeroDimensional?}{LexTriangularPackage}` operation to check whether this requirement holds. There is also a `\axiomOpFrom{groebner}{LexTriangularPackage}` operation to compute the lexicographical Groebner basis of a set of polynomials with type `\spadtype{NewSparseMultivariatePolynomial(R,V)}`. The elimination ordering is that given by `\bf ls` (the greatest variable being the first element of `\bf ls`). This basis is computed by the `\em FLGM` algorithm (Faugere et al. "Efficient Computation of Zero-Dimensional Groebner Bases by Change of Ordering", J. of Symbol. Comput., 1993) implemented in the `\spadtype{LinGroebnerPackage}` package constructor. Once a lexicographical Groebner basis is computed,

then one can call the operations
`\axiomOpFrom{lexTriangular}{LexTriangularPackage}`
and `\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}`.
Note that these operations admit an optional argument
to produce normalized triangular sets.
There is also a `\axiomOpFrom{zeroSetSplit}{LexTriangularPackage}`
operation which does all the job from the input system;
an error is produced if this system is not zero-dimensional.

Let us illustrate the facilities of the `\spadtype{LEXTRIPK}` constructor
by a famous example, the `{\em cyclic-6 root}` system.

```
\xctc{
Define the coefficient ring.
}{
\spadpaste{R := Integer \bound{R}}
}
\xctc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [a,b,c,d,e,f] \bound{ls}}
}
\xctc{
and make it an ordered set.
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
\xctc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
\xctc{
Define the polynomials.
}{
\spadpaste{p1: P := a*b*c*d*e*f - 1 \free{P} \bound{p1}}
}
\xctc{
}{
\spadpaste{p2: P := a*b*c*d*e + a*b*c*d*f + a*b*c*e*f + a*b*d*e*f +
a*c*d*e*f + b*c*d*e*f \free{P} \bound{p2}}
}
\xctc{
}{
\spadpaste{p3: P := a*b*c*d + a*b*c*f + a*b*e*f + a*d*e*f +
b*c*d*e + c*d*e*f \free{P} \bound{p3}}
}
\xctc{
}{
\spadpaste{p4: P := a*b*c + a*b*f + a*e*f + b*c*d + c*d*e + d*e*f
\free{P} \bound{p4}}
```

```

}
\xtc{
}{
\spadpaste{p5: P := a*b + a*f + b*c + c*d + d*e + e*f \free{P}
\bound{p5}}
}
\xtc{
}{
\spadpaste{p6: P := a + b + c + d + e + f \free{P} \bound{p6}}
}
\xtc{
}{
\spadpaste{lp := [p1, p2, p3, p4, p5, p6] \free{p1} \free{p2}
\free{p3} \free{p4} \free{p5} \free{p6} \bound{lp}}
}
\xtc{
Now call \spadtype{LEXTRIPK} .
}{
\spadpaste{lextripack := LEXTRIPK(R,ls) \free{R} \free{ls}
\bound{lextripack}}
}
\xtc{
Compute the lexicographical Groebner basis of the system.
This may take between 5 minutes and one hour, depending on your machine.
}{
\spadpaste{lg := groebner(lp)$lextripack \free{lp}
\free{lextripack} \bound{lg}}
}
\xtc{
Apply lexTriangular to compute a decomposition into regular triangular sets.
This should not take more than 5 seconds.
}{
\spadpaste{lexTriangular(lg,false)$lextripack \free{lg}
\free{lextripack}}
}
Note that the first set of the decomposition is normalized
(all initials are integer numbers) but not the second one
(normalized triangular sets are defined in the
description of the \spadtype{NormalizedTriangularSetCategory}
constructor).
\xtc{
So apply now lexTriangular to produce normalized triangular sets.
}{
\spadpaste{lts := lexTriangular(lg,true)$lextripack \free{lg}
\free{lextripack} \bound{lts}}
}
\xtc{
We check that all initials are constant.
}{
\spadpaste{[[init(p) for p in (ts :: List(P))] for ts in lts]}

```

```
\free{lhs}
}
```

Note that each triangular set in $\{\mathbf{lts}\}$ is a lexicographical Groebner basis.

Recall that a point belongs to the variety associated with $\{\mathbf{lp}\}$ if and only if it belongs to that associated with one triangular set $\{\mathbf{ts}\}$ in $\{\mathbf{lts}\}$.

By running the `\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}` operation, we retrieve the above decomposition.

```
\xtc{
}{
\spadpaste{squareFreeLexTriangular(lg,true)$lextripack \free{lg}
\free{lextripack}}
}
```

Thus the solutions given by $\{\mathbf{lts}\}$ are pairwise different.

```
\xtc{
We count them as follows.
}{
\spadpaste{reduce(+,[degree(ts) for ts in lhs]) \free{lhs}}
}
```

We can investigate the triangular decomposition $\{\mathbf{lts}\}$ by using the `\spadtype{ZeroDimensionalSolvePackage}`.

```
\xtc{
This requires to add an extra variable (smaller than the others) as follows.
}{
\spadpaste{ls2 : List Symbol := concat(ls,new()$Symbol) \free{ls}
\bound{ls2}}
}
```

```
\xtc{
Then we call the package.
}{
\spadpaste{zdpack := ZDSOLVE(R,ls,ls2) \free{R} \free{ls}
\free{ls2} \bound{zdpack}}
}
```

```
\xtc{
We compute a univariate representation of the variety associated with
the input system as follows.
}{
```

```
\spadpaste{concat [univariateSolve(ts)$zdpack for ts in lhs]
\free{lhs} \free{zdpack}}
}
```

Since the `\axiomOpFrom{univariateSolve}{ZeroDimensionalSolvePackage}` operation may

split a regular set, it returns a list. This explains the use of `\axiomOpFrom{concat}{List}`.

Look at the last item of the result. It consists of two parts. For any complex root `{\bf ?}` of the univariate polynomial in the first part, we get a tuple of univariate polynomials (in `{\bf a}`, ..., `{\bf f}` respectively) by replacing `{\bf \%A}` by `{\bf ?}` in the second part. Each of these tuples `{\bf t}` describes a point of the variety associated with `{\bf lp}` by equaling to zero the polynomials in `{\bf t}`.

Note that the way of reading these univariate representations is explained also in the example illustrating the `\spadtype{ZeroDimensionalSolvePackage}` constructor.

```
\xctc{
Now, we compute the points of the variety with real coordinates.
}{
\spadpaste{concat [realSolve(ts)$zdpack for ts in lts] \free{lts}
\free{zdpack}}
}
We obtain 24 points given by lists of elements in the
\spadtype{RealClosure} of \spadtype{Fraction} of {\bf R}.
In each list, the first value corresponds to the indeterminate {\bf f},
the second to {\bf e} and so on.
See \spadtype{ZeroDimensionalSolvePackage} to learn more about
the \axiomOpFrom{realSolve}{ZeroDimensionalSolvePackage} operation.
```

\begin{page}{LibraryXmpPage}{Library}
\beginscroll
```

The `\spadtype{Library}` domain provides a simple way to store Axiom values in a file. This domain is similar to `\spadtype{KeyedAccessFile}` but fewer declarations are needed and items of different types can be saved together in the same file.

```
\xtc{
To create a library, you supply a file name.
}{
\spadpaste{stuff := library "/tmp/Neat.stuff" \bound{stuff}}
}
\xtc{
Now values can be saved by key in the file.
The keys should be mnemonic, just as the field names are for records.
They can be given either as strings or symbols.
}{
\spadpaste{stuff.int      := 32**2      \free{stuff}\bound{stuffa}}
}
\xtc{
}{
\spadpaste{stuff."poly" := x**2 + 1 \free{stuffa}\bound{stuffb}}
}
\xtc{
}{
\spadpaste{stuff.str      := "Hello"    \free{stuffb}\bound{stuffc}}
}
\xtc{
You obtain
the set of available keys using the \spadfunFrom{keys}{Library} operation.
}{
\spadpaste{keys stuff \free{stuffa,stuffb,stuffc}\bound{stuffabc}}
}
\xtc{
You extract values by giving the desired key in this way.
}{
\spadpaste{stuff.poly      \free{stuffb}}
}
\xtc{
}{
\spadpaste{stuff("poly") \free{stuffb}}
}
\noOutputXtc{
When the file is no longer needed, you should remove it from the
file system.
}{
\spadpaste{)system rm -rf /tmp/Neat.stuff \free{stuff}\bound{rmstuff}}
}
```

```

\beginscroll
A \spadgloss{list} is a finite collection of elements in a specified
order that can contain duplicates.
A list is a convenient structure to work with because it is easy
to add or remove elements and the length need not be constant.
There are many different kinds of lists in Axiom, but the
default types (and those used most often) are created by the
\spadtype{List} constructor.
For example, there are objects of type \spadtype{List Integer},
\spadtype{List Float} and \spadtype{List Polynomial Fraction Integer}.
Indeed, you can even have \spadtype{List List List Boolean}
(that is, lists of lists of lists of Boolean values).
You can have lists of any type of Axiom object.

Creating Lists

— list.ht —

```
\begin{page}{ugxListCreatePage}{Creating Lists}
\beginscroll
```

The easiest way to create a list with, for example, the elements $\text{\spad}\{2, 4, 5, 6\}$ is to enclose the elements with square brackets and separate the elements with commas.

```
\xhc{
```

The spaces after the commas are optional, but they do improve the readability.

```
}{
```

```
\spadpaste{[2, 4, 5, 6]}
```

```
}
```

```
\xhc{
```

To create a list with the single element $\text{\spad}\{1\}$, you can use either $\text{\spad}\{[1]\}$ or the operation $\text{\spad}\text{funFrom}\{\text{list}\}\{\text{List}\}$.

```
}{
```

```
\spadpaste{[1]}
```

```
}
```

```
\xhc{
```

```
}{
```

```
\spadpaste{list(1)}
```

```
}
```

```
\xhc{
```

Once created, two lists $\text{\spad}\{k\}$ and $\text{\spad}\{m\}$ can be concatenated by issuing $\text{\spad}\{\text{append}(k,m)\}$.

$\text{\spad}\text{funFrom}\{\text{append}\}\{\text{List}\}$ does *not* physically join the lists, but rather produces a new list with the elements coming from the two arguments.

```
}{
```

```
\spadpaste{append([1,2,3],[5,6,7])}
```

```
}
```

```
\xhc{
```

Use $\text{\spad}\text{funFrom}\{\text{cons}\}\{\text{List}\}$ to append an element onto the front of a list.

```
}{
```

```
\spadpaste{cons(10,[9,8,7])}
```

```
}
```

```
\endscroll

Accessing List Elements

— list.ht —

```

\begin{page}{ugxListAccessPage}{Accessing List Elements}
\beginscroll

\labelSpace{4pc}
\xtc{
To determine whether a list has any elements, use the operation
\spadfunFrom{empty?}{List}.
}{
\spadpaste{empty? [x+1]}
}
\xtc{
Alternatively, equality with the list constant \spadfunFrom{nil}{List}
can be tested.
}{

```

```

\spadpaste{([[] = nil)@Boolean}
}

\xtc{
We'll use this in some of the following examples.
}{
\spadpaste{k := [4,3,7,3,8,5,9,2] \bound{k}}
}
\xtc{
Each of the next four expressions extracts the \spadfunFrom{first}{List}
element of \spad{k}.
}{
\spadpaste{first k \free{k}}
}
\xtc{
}{
\spadpaste{k.first \free{k}}
}
\xtc{
}{
\spadpaste{k.1 \free{k}}
}
\xtc{
}{
\spadpaste{k(1) \free{k}}
}
The last two forms generalize to \spad{k.i} and \spad{k(i)},
respectively, where
\texht{$ 1 \leq i \leq n$}{\spad{1 <= i <= n}}
and
\spad{n} equals the length of \spad{k}.
\xtc{
This length is calculated by \spadopFrom{\#}{List}.
}{
\spadpaste{n := \#k \free{k}}
}
Performing an operation such as \spad{k.i} is sometimes
referred to as {\it indexing into k} or
{\it elting into k}.
The latter phrase comes about because the name of the operation
that extracts elements is called \spadfunFrom{elt}{List}.
That is, \spad{k.3} is just alternative syntax for \spad{elt(k,3)}.
It is important to remember that list indices
begin with 1.
If we issue \spad{k := [1,3,2,9,5]} then \spad{k.4}
returns \spad{9}.
It is an error to use an index that is not in the range from
\spad{1} to the length of the list.

\xtc{

```

The last element of a list is extracted by any of the following three expressions.

```
{
\spadpaste{last k \free{k}}
}
```

```
\xctc{
```

```
{
\spadpaste{k.last \free{k}}
}
```

```
\xctc{
```

This form computes the index of the last element and then extracts the element from the list.

```
{
\spadpaste{k.(#k) \free{k}}
}
```

```

Changing List Elements

— list.ht —

```
\begin{page}{ugxListChangePage}{Changing List Elements}
\beginscroll

\labelSpace{4pc}
\xtc{
We'll use this in some of the following examples.
}{
\spadpaste{k := [4,3,7,3,8,5,9,2] \bound{k}}
}
\xtc{
List elements are reset by using the \spad{k.i} form on
the left-hand side of an assignment.
This expression resets the first element of \spad{k} to \spad{999}.
}{
\spadpaste{k.1 := 999 \free{k}\bound{k1}}
}
\xtc{
As with indexing into a list, it is an error to use an index
that is not within the proper bounds.
Here you see that \spad{k} was modified.
}{
\spadpaste{k \free{k1}}
}
```

The operation that performs the assignment of an element to a particular position in a list is called `\spadfunFrom{setelt}{List}`. This operation is *destructive* in that it changes the list. In the above example, the assignment returned the value `\spad{999}` and `\spad{k}` was modified.

For this reason, lists are called `\spadglos{mutable}` objects: it is possible to change part of a list (mutate it) rather than always returning a new list reflecting the intended modifications.

```
\xtc{
Moreover, since lists can share structure, changes to one list can
sometimes affect others.
}{
\spadpaste{k := [1,2] \bound{k2}}
}
\xtc{
}{
\spadpaste{m := cons(0,k) \free{k2}\bound{m}}
}
\xtc{
Change the second element of \spad{m}.
}{
```

```

\spadpaste{m.2 := 99 \free{m}\bound{m2}}
}
\xtc{
See, \spad{m} was altered.
}{
\spadpaste{m \free{m2}}
}
\xtc{
But what about \spad{k}?
It changed too!
}{
\spadpaste{k \free{m2 k2}}
}

\endscroll

Other Functions

— list.ht —

```

\begin{page}{\ugxListOtherPage}{Other Functions}
\beginscroll

\labelSpace{3pc}
\xtc{
An operation that is used frequently in list processing is that
which returns all elements in a list after the first element.
}{
\spadpaste{k := [1,2,3] \bound{k}}
}
\xtc{
Use the \spadfunFrom{rest}{List} operation to do this.
}{
\spadpaste{rest k \free{k}}
}

\xtc{
To remove duplicate elements in a list \spad{k}, use
\spadfunFrom{removeDuplicates}{List}.
}{
\spadpaste{removeDuplicates [4,3,4,3,5,3,4]}
}
\xtc{
To get a list with elements in the order opposite to those in
a list \spad{k}, use \spadfunFrom{reverse}{List}.
}{
\spadpaste{reverse [1,2,3,4,5,6]}
}
\xtc{
To test whether an element is in a list, use \spadfunFrom{member?}{List}:
\spad{member?(a,k)} returns \spad{true} or \spad{false}
depending on whether \spad{a} is in \spad{k} or not.
}{
\spadpaste{member?(1/2,[3/4,5/6,1/2])}
}
\xtc{
}{
\spadpaste{member?(1/12,[3/4,5/6,1/2])}
}

As an exercise, the reader should determine how to get a
list containing all but the last of the elements in a given non-empty
list \spad{k}. \footnote{\spad{reverse(rest(reverse(k)))} works.}

Dot, Dot

— list.ht —

```
\begin{page}{ugxListDotPage}{Dot, Dot}
\beginscroll
```

Certain lists are used so often that Axiom provides an easy way of constructing them.
 If `\spad{n}` and `\spad{m}` are integers, then `\spad{expand [n..m]}` creates a list containing `\spad{n, n+1, ... m}`.
 If `\spad{n > m}` then the list is empty.
 It is actually permissible to leave off the `\spad{m}` in the dot-dot construction (see below).

```
\xctc{
The dot-dot notation can be used more than once in a list
construction and with specific elements being given.
Items separated by dots are called {\it segments.}
}{
\spadpaste{[1..3,10,20..23]}
}
\xctc{
Segments can be expanded into the range of items between the
endpoints by using \spadfunFrom{expand}{Segment}.
}{
\spadpaste{expand [1..3,10,20..23]}
}
\xctc{
What happens if we leave off a number on the right-hand side of
\spadopFrom{..}{UniversalSegment}?
}{
\spadpaste{expand [1..]}
}
What is created in this case is a \spadtype{Stream} which is a
generalization of a list.
See \downlink{'Stream'}{StreamXmpPage}\ignore{Stream} for more information.

\begin{page}{LinearOrdinaryDifferentialOperatorXmpPage}
{LinearOrdinaryDifferentialOperator}
\beginscroll

\spadtype{LinearOrdinaryDifferentialOperator(A, diff)} is the
domain of linear ordinary differential operators with coefficients
in a ring \spad{A} with a given derivation.
%This includes the cases of operators which are polynomials in \spad{D}
%acting upon scalar or vector expressions of a single variable.
%The coefficients of the operator polynomials can be integers, rational
%functions, matrices or elements of other domains.

\begin{page}{LinearOrdinaryDifferentialOperatorOneXmpPage}
{LinearOrdinaryDifferentialOperator1}
\beginscroll

\spadtype{LinearOrdinaryDifferentialOperator1(A)} is the domain of
linear ordinary differential operators with coefficients in the
differential ring \spad{A}.
%This includes the cases of operators which are polynomials in \spad{D}
%acting upon scalar or vector expressions of a single variable.
%The coefficients of the operator polynomials can be integers, rational
%functions, matrices or elements of other domains.
\showBlurb{LinearOrdinaryDifferentialOperator1}

Differential Operators with Rational Function Coefficients

— lodo1.ht —

```

\begin{page}{\ugxLinearOrdinaryDifferentialOperatorOneRatPage}
{Differential Operators with Rational Function Coefficients}
\beginscroll

```

This example shows differential operators with rational function coefficients. In this case operator multiplication is non-commutative and, since the coefficients form a field, an operator division algorithm exists.

```

\labelSpace{2pc}
\xtc{
We begin by defining \spad{RFZ} to be the rational functions in
\spad{x} with integer coefficients and \spad{Dx} to be the differential
operator for \spad{d/dx}.
}{
\spadpaste{RFZ := Fraction UnivariatePolynomial('x, Integer) \bound{RFZ0}}
}
\xtc{
}{
\spadpaste{x : RFZ := 'x \free{RFZ0}\bound{RFZ}}
}
\xtc{
}{
\spadpaste{Dx : LOD01 RFZ := D()\bound{Dx}\free{RFZ}}
}
\xtc{
Operators are created using the usual arithmetic operations.
}{
\spadpaste{b : LOD01 RFZ := 3*x**2*Dx**2 + 2*Dx + 1/x \free{Dx}\bound{b}}
}
\xtc{
}{
\spadpaste{a : LOD01 RFZ := b*(5*x*Dx + 7) \free{b Dx}\bound{a}}
}
\xtc{
Operator multiplication corresponds to functional composition.
}{

```

```

\spadpaste{p := x**2 + 1/x**2 \bound{p}\free{RFZ}}
}
\xtc{
Since operator coefficients depend on \spad{x}, the multiplication is
not commutative.
}{
\spadpaste{(a*b - b*a) p \free{a b p}}
}

```

When the coefficients of operator polynomials come from a field, as in this case, it is possible to define operator division. Division on the left and division on the right yield different results when the multiplication is non-commutative.

```

The results of
\spadfunFrom{leftDivide}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightDivide}{LinearOrdinaryDifferentialOperator1} are
quotient-remainder pairs satisfying: \newline
%
\spad{leftDivide(a,b) = [q, r]} such that \spad{a = b*q + r} \newline
\spad{rightDivide(a,b) = [q, r]} such that \spad{a = q*b + r} \newline
%
\xtc{
In both cases, the
\spadfunFrom{degree}{LinearOrdinaryDifferentialOperator1}
of the remainder, \spad{r}, is less than
the degree of \spad{b}.
}{
\spadpaste{ld := leftDivide(a,b) \bound{ld}\free{a b}}
}
\xtc{
}{
\spadpaste{a = b * ld.quotient + ld.remainder \free{a b ld}}
}
\xtc{
The operations of left and right division
are so-called because the quotient is obtained by dividing
\spad{a} on that side by \spad{b}.
}{
\spadpaste{rd := rightDivide(a,b) \bound{rd}\free{a b}}
}
\xtc{
}{
\spadpaste{a = rd.quotient * b + rd.remainder \free{a b rd}}
}

\xtc{
Operations \spadfunFrom{rightQuotient}{LinearOrdinaryDifferentialOperator1}
and \spadfunFrom{rightRemainder}{LinearOrdinaryDifferentialOperator1}
are available if only one of the quotient or remainder are of

```

```

interest to you.
This is the quotient from right division.
}{
\spadpaste{rightQuotient(a,b) \free{a b}}
}
\xtc{
This is the remainder from right division.
The corresponding ‘left’ functions
\spadfunFrom{leftQuotient}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{leftRemainder}{LinearOrdinaryDifferentialOperator1}
are also available.
}{
\spadpaste{rightRemainder(a,b) \free{a b}}
}

\xtc{
For exact division, the operations
\spadfunFrom{leftExactQuotient}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightExactQuotient}{LinearOrdinaryDifferentialOperator1}
are supplied.
These return the quotient but only if the remainder is zero.
The call \spad{rightExactQuotient(a,b)} would yield an error.
}{
\spadpaste{leftExactQuotient(a,b) \free{a b}}
}

\xtc{
The division operations allow the computation of left and right
greatest common divisors
(\spadfunFrom{leftGcd}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightGcd}{LinearOrdinaryDifferentialOperator1}) via
remainder sequences, and consequently the computation of left and
right least common
multiples (\spadfunFrom{rightLcm}{LinearOrdinaryDifferentialOperator1}
and
\spadfunFrom{leftLcm}{LinearOrdinaryDifferentialOperator1}).
}{
\spadpaste{e := leftGcd(a,b) \bound{e}\free{a b}}
}
\xtc{
Note that a greatest common divisor doesn’t necessarily divide \spad{a} and
{9.45.1.}{Differential Operators with Rational Function Coefficients}
\spad{b} on both sides.
Here the left greatest common divisor does not divide \spad{a} on the right.
}{
\spadpaste{leftRemainder(a, e) \free{a e}}
}
\xtc{
}{
\spadpaste{rightRemainder(a, e) \free{a e}}
}

```

```

}

\xtc{
Similarly, a least common multiple
is not necessarily divisible from both sides.
}{
\spadpaste{f := rightLcm(a,b) \bound{f}\free{a b}}
}
\xtc{
}{
\spadpaste{rightRemainder(f, b) \free{f b}}
}
\xtc{
}{
\spadpaste{leftRemainder(f, b) \free{f b}}
}

$\spadtype{LinearOrdinaryDifferentialOperator2(A, M)}$ is the domain of linear ordinary differential operators with coefficients in the differential ring \spad{A} and operating on \spad{M} , an \spad{A} -module. This includes the cases of operators which are

polynomials in $\text{\spad{D}}$ acting upon scalar or vector expressions of a single variable. The coefficients of the operator polynomials can be integers, rational functions, matrices or elements of other domains.

Differential Operators with Constant Coefficients

— lodo2.ht —

```
\begin{page}{ugxLinearODEOperatorTwoConstPage}
{Differential Operators with Constant Coefficients}
\beginscroll
```

This example shows differential operators with rational number coefficients operating on univariate polynomials.

```
\labelSpace{3pc}
\xtc{
We begin by making type assignments so we can conveniently refer
to univariate polynomials in  $\text{\spad{x}}$  over the rationals.
}{
\spadpaste{Q := Fraction Integer \bound{Q}}
}
\xtc{
}{
\spadpaste{PQ := UnivariatePolynomial('x, Q) \free{Q}\bound{PQ0}}
}
\xtc{
}{
\spadpaste{x: PQ := 'x \free{PQ0}\bound{x}}
}
\xtc{
```

```

Now we assign \spad{Dx} to be the differential operator
\spadfunFrom{D}{LinearOrdinaryDifferentialOperator2}
corresponding to \spad{d/dx}.
}{
\spadpaste{Dx: LODO2(Q, PQ) := D() \free{Q PQ}\bound{Dx}}
}
\xtc{
New operators are created as polynomials in \spad{D()}.
}{
\spadpaste{a := Dx + 1 \bound{a}\free{Dx}}
}
\xtc{
}{
\spadpaste{b := a + 1/2*Dx**2 - 1/2 \bound{b}\free{Dx}}
}
\xtc{
To apply the operator \spad{a} to the value \spad{p} the usual function
call syntax is used.
}{
\spadpaste{p := 4*x**2 + 2/3 \free{x}\bound{p}}
}
\xtc{
}{
\spadpaste{a p \free{a p}}
}
\xtc{
Operator multiplication is defined by the identity \spad{(a*b) p = a(b(p))}
}{
\spadpaste{(a * b) p = a b p \free{a b p}}
}
\xtc{
Exponentiation follows from multiplication.
}{
\spadpaste{c := (1/9)*b*(a + b)**2 \free{a b}\bound{c}}
}
\xtc{
Finally, note that operator expressions may be applied directly.
}{
\spadpaste{(a**2 - 3/4*b + c) (p + 1) \free{a b c p}}
}

Differential Operators with Matrix Coefficients Operating on Vectors

— lodo2.ht —

```

\begin{page}{ugxLinearODEOperatorTwoMatrixPage}
{Differential Operators with Matrix Coefficients Operating on Vectors}
\begin{scroll}

```

This is another example of linear ordinary differential operators with non-commutative multiplication. Unlike the rational function case, the differential ring of

square matrices (of a given dimension) with univariate polynomial entries does not form a field.
Thus the number of operations available is more limited.

```

\labelSpace{1pc}

{\em S}, a domain of category \spadtype{SetCategory}
\newline\tab{10}...
\indent{0}\newline\tab{2}{\em Returns:}\indent{15}\tab{0}
the class of mappings from domain ({\em S,...})
into domain {\em T} as described below.
\indent{0}\newline\tab{2}{\em Description:}\indent{15}\tab{0}
{\em Mapping}(T,S,...) denotes the class of objects which are
mappings from a source domain ({\em S,...}) into a target domain {\em T}.
The {\em Mapping} constructor can take any number of arguments.
All but the first argument is regarded as part of a source tuple
for the mapping.
For example, {\em Mapping}(T,A,B) denotes the
class of mappings from {\em (A,B)} into {\em T}.
{\em Mapping} is a primitive domain of Axiom which cannot be
defined in the Axiom language.

MappingPackage1

— mappkg1.ht —

```
\begin{page}{MappingPackageOneXmpPage}{MappingPackage1}
\beginscroll

Function are objects of type \spadtype{Mapping}.
In this section we demonstrate some library operations from the
```

packages `\spadtype{MappingPackage1}`, `\spadtype{MappingPackage2}`, and `\spadtype{MappingPackage3}` that manipulate and create functions. Some terminology: a `\it nullary` function takes no arguments, a `\it unary` function takes one argument, and a `\it binary` function takes two arguments.

```
\xctc{
We begin by creating an example function that raises a
rational number to an integer exponent.
}{
\spadpaste{power(q: FRAC INT, n: INT): FRAC INT == q**n \bound{power}}
}
\xctc{
}{
\spadpaste{power(2,3) \free{power}}
}
\xctc{
The \spadfunFrom{twist}{MappingPackage3} operation
transposes the arguments of a binary function.
Here \spad{rewop(a, b)} is \spad{power(b, a)}.
}{
\spadpaste{rewop := twist power \free{power}\bound{rewop}}
}
\xctc{
This is \texht{$2^3$}\{\spad{2**3.}\}
}{
\spadpaste{rewop(3, 2) \free{rewop}}
}
\xctc{
Now we define \userfun{square} in terms of \userfun{power}.
}{
\spadpaste{square: FRAC INT -> FRAC INT \bound{squareded}}
}
\xctc{
The \spadfunFrom{curryRight}{MappingPackage3} operation creates a unary
function from a binary one by providing a constant
argument on the right.
}{
\spadpaste{square:= curryRight(power, 2) \free{squareded poswer}
\bound{square}}
}
\xctc{
Likewise, the
\spadfunFrom{curryLeft}{MappingPackage3} operation provides a constant
argument on the left.
}{
\spadpaste{square 4 \free{square}}
}
\xctc{
The \spadfunFrom{constantRight}{MappingPackage3} operation creates
```

```

(in a trivial way) a binary function from a unary one:
\spad{constantRight(f)} is the function \spad{g} such that
\spad{g(a,b)= f(a).}
}{
\spadpaste{squirrel:= constantRight(square)\$MAPPKG3(FRAC INT,
FRAC INT,FRAC INT) \free{square}\bound{squirrel}}
}
\xtc{
Likewise,
\spad{constantLeft(f)} is the function \spad{g} such that
\spad{g(a,b)= f(b).}
}{
\spadpaste{squirrel(1/2, 1/3) \free{squirrel}}
}
\xtc{
The \spadfunFrom{curry}{MappingPackage2} operation makes a
unary function nullary.
}{
\spadpaste{sixteen := curry(square, 4/1) \free{square}\bound{sixteen}}
}
\xtc{
}{
\spadpaste{sixteen() \free{sixteen}}
}
\xtc{
The \spadopFrom{*}{MappingPackage3} operation
constructs composed functions.
}{
\spadpaste{square2:=square*square \free{square}\bound{square2}}
}
\xtc{
}{
\spadpaste{square2 3 \free{square2}}
}
\xtc{
Use the \spadopFrom{**}{MappingPackage1} operation to create
functions that are \spad{n}-fold iterations of other functions.
}{
\spadpaste{sc(x: FRAC INT): FRAC INT == x + 1 \bound{sc}}
}
\xtc{
This is a list of \pspadtype{Mapping} objects.
}{
\spadpaste{incfns := [sc**i for i in 0..10] \free{sc}\bound{incfns}}
}
\xtc{
This is a list of applications of those functions.
}{
\spadpaste{[f 4 for f in incfns] \free{incfns}}
}

```

```

\xtc{
Use the \spadfunFrom{recur}{MappingPackage1}
operation for recursion:
\spad{g := recur f} means \spad{g(n,x) == f(n,f(n-1,...f(1,x)))}.}
}{
\spadpaste{times(n:NNI, i:INT):INT == n*i \bound{rdec}}
}
\xtc{
}{
\spadpaste{r := recur(times) \free{rdec}\bound{r}}
}
\xtc{
This is a factorial function.
}{
\spadpaste{fact := curryRight(r, 1) \free{r}\bound{fact}}
}
\xtc{
}{
\spadpaste{fact 4 \free{fact}}
}
\xtc{
Constructed functions can be used within other functions.
}{
\begin{spadsrc}[\free{square}\bound{mto2ton}]
mto2ton(m, n) ==
  raiser := square**n
  raiser m
\end{spadsrc}
}
\xtc{
This is \texht{$3^{2^3}$.}$\{\spad{3**(2**3).}\}
}{
\spadpaste{mto2ton(3, 3) \free{mto2ton}}
}
\xtc{
Here \userfun{shiftfib} is a unary function that modifies its argument.
}{
\begin{spadsrc}[\bound{shiftfib}]
shiftfib(r: List INT) : INT ==
  t := r.1
  r.1 := r.2
  r.2 := r.2 + t
  t
\end{spadsrc}
}
\xtc{
By currying over the argument we get a function with private state.
}{
\spadpaste{fibinit: List INT := [0, 1] \bound{fibinitdec}}
}

```

```

\xtc{
}{
\spadpaste{fibs := curry(shiftfib, fibinit)
\free{shiftfib fibinit}\bound{fibs}}
}
\xtc{
}{
\spadpaste{[fibs() for i in 0..30] \free{fibs}}
}
\endscroll

MultiSet

— mset.ht —

```

\begin{page}{MultiSetXmpPage}{MultiSet}
\begin{scroll}
The domain \spadtype{Multiset(R)} is similar to \spadtype{Set(R)}
except that multiplicities
(counts of duplications) are maintained and displayed.
Use the operation \spadfunFrom{multiset}{Multiset} to create
multisets from lists.
All the standard operations from sets are available for
multisets.
An element with multiplicity greater than one has the
multiplicity displayed first, then a colon, and then the element.

\xtc{
Create a multiset of integers.
}{
\spadpaste{s := multiset [1,2,3,4,5,4,3,2,3,4,5,6,7,4,10]\bound{s}}
}
\xtc{
The operation \spadfunX{insert} adds an element to a multiset.
}{
\spadpaste{insert!(3,s)\bound{s1}\free{s}}
}
\xtc{
Use \spadfunX{remove} to remove an element.
If a third argument is present, it specifies how many instances
to remove. Otherwise all instances of the element are removed.
Display the resulting multiset.
}{
\spadpaste{remove!(3,s,1); s\bound{s2}\free{s1}}
}
\xtc{
}{

```

```

\spadpaste{remove!(5,s); s\bound{s2}\free{s1}}
}
\xtc{
The operation \spadfun{count} returns the number of copies
of a given value.
}{
\spadpaste{count(5,s)\free{s2}}
}
\xtc{
A second multiset.
}{
\spadpaste{t := multiset [2,2,2,-9]\bound{t}}
}
\xtc{
The \spadfun{union} of two multisets is additive.
}{
\spadpaste{U := union(s,t)\bound{U}}
}
\xtc{
The \spadfun{intersect} operation gives the elements that are in
common, with additive multiplicity.
}{
\spadpaste{I := intersect(s,t)\bound{I}}
}
\xtc{
The \spadfun{difference} of \spad{s} and \spad{t} consists of
the elements that \spad{s} has but \spad{t} does not.
Elements are regarded as indistinguishable, so that if \spad{s}
and \spad{t} have any element in common, the \spadfun{difference}
does not contain that element.
}{
\spadpaste{difference(s,t)\free{s2 t}}
}
\xtc{
The \spadfun{symmetricDifference} is the \spadfun{union}
of \spad{difference(s, t)} and \spad{difference(t, s)}.
}{
\spadpaste{S := symmetricDifference(s,t)\bound{S}\free{s2 t}}
}
\xtc{
Check that the \spadfun{union} of the \spadfun{symmetricDifference} and
the \spadfun{intersect} equals the \spadfun{union} of the elements.
}{
\spadpaste{(U = union(S,I))@Boolean\free{S I U}}
}
\xtc{
Check some inclusion relations.
}{
\spadpaste{t1 := multiset [1,2,2,3]; [t1 < t, t1 < s, t < s, t1 <= s]
\free{t s2}}
}

```

```

\beginscroll
```

The `\spadtype{Matrix}` domain provides arithmetic operations on matrices and standard functions from linear algebra.

This domain is similar to the `\spadtype{TwoDimensionalArray}` domain, except that the entries for `\spadtype{Matrix}` must belong to a `\spadtype{Ring}`.

```

—————

Creating Matrices

— matrix.ht —

```
\begin{page}{ugxMatrixCreatePage}{Creating Matrices}
\beginscroll
```

There are many ways to create a matrix from a collection of values or from existing matrices.

```
\xctc{
If the matrix has almost all items equal to the same value,
use \spadfunFrom{new}{Matrix} to create a matrix filled with that
value and then reset the entries that are different.
}{
\spadpaste{m : Matrix(Integer) := new(3,3,0) \bound{m}}
}
\xctc{
To change the entry in the second row, third column to \spad{5}, use
```

```

\spadfunFrom{setelt}{Matrix}.
}{
\spadpaste{setelt(m,2,3,5) \free{m}\bound{m1}}
}
\xtc{
An alternative syntax is to use assignment.
}{
\spadpaste{m(1,2) := 10 \free{m1}\bound{m2}}
}
\xtc{
The matrix was {\it destructively modified}.
}{
\spadpaste{m \free{m2}}
}

\xtc{
If you already have the matrix entries as a list of lists,
use \spadfunFrom{matrix}{Matrix}.
}{
\spadpaste{matrix [[1,2,3,4],[0,9,8,7]]}
}

\xtc{
If the matrix is diagonal, use
\spadfunFrom{diagonalMatrix}{Matrix}.
}{
\spadpaste{dm := diagonalMatrix [1,x**2,x**3,x**4,x**5] \bound{dm}}
}
\xtc{
Use \spadfunFromX{setRow}{Matrix} and
\spadfunFromX{setColumn}{Matrix} to change a row or column of a matrix.
}{
\spadpaste{setRow!(dm,5,vector [1,1,1,1,1]) \free{dm}\bound{dm1}}
}
\xtc{
}{
\spadpaste{setColumn!(dm,2,vector [y,y,y,y,y]) \free{dm1}\bound{dm2}}
}

%
\xtc{
Use \spadfunFrom{copy}{Matrix} to make a copy of a matrix.
}{
\spadpaste{cdm := copy(dm) \free{dm2}\bound{cdm}}
}
\xtc{
This is useful if you intend to modify a matrix destructively but
want a copy of the original.
}{
\spadpaste{setelt(dm,4,1,1-x**7) \free{dm2}\bound{setdm}}
}

```

```

}
\xtc{
}{
\spadpaste{[dm,cdm] \free{setdm cdm}}
}

%
\xtc{
Use \spadfunFrom{subMatrix}{Matrix} to extract part of an
existing matrix.
The syntax is \spad{subMatrix({\it m, firstrow, lastrow, firstcol,
lastcol})}.
}{
\spadpaste{subMatrix(dm,2,3,2,4) \free{setdm}}
}

%
\xtc{
To change a submatrix, use \spadfunFromX{setsubMatrix}{Matrix}.
}{
\spadpaste{d := diagonalMatrix [1.2,-1.3,1.4,-1.5] \bound{d}}
}
\xtc{
If \spad{e} is too big to fit where you specify, an error message
is displayed.
Use \spadfunFrom{subMatrix}{Matrix} to extract part of \spad{e}, if
necessary.
}{
\spadpaste{e := matrix [[6.7,9.11],[-31.33,67.19]] \bound{e}}
}
\xtc{
This changes the submatrix of \spad{d} whose upper left corner is
at the first row and second column and whose size is that of \spad{e}.
}{
\spadpaste{setsubMatrix!(d,1,2,e) \free{d e}\bound{d1}}
}
\xtc{
}{
\spadpaste{d \free{d1}}
}
%

%
\xtc{
Matrices can be joined either horizontally or vertically to make
new matrices.
}{
\spadpaste{a := matrix [[1/2,1/3,1/4],[1/5,1/6,1/7]] \bound{a}}
}
\xtc{

```

```

}{
\spadpaste{b := matrix [[3/5,3/7,3/11],[3/13,3/17,3/19]] \bound{b}}
}
\xtc{
Use \spadfunFrom{horizConcat}{Matrix} to append them side to side.
The two matrices must have the same number of rows.
}{
\spadpaste{horizConcat(a,b) \free{a b}}
}
\xtc{
Use \spadfunFrom{vertConcat}{Matrix} to stack one upon the other.
The two matrices must have the same number of columns.
}{
\spadpaste{vab := vertConcat(a,b) \free{a b}\bound{vab}}
}

%
\xtc{
The operation
\spadfunFrom{transpose}{Matrix} is used to create a new matrix by
reflection across the main diagonal.
}{
\spadpaste{transpose vab \free{vab}}
}

\begin{page}{ugxMatrixOpsPage}{Operations on Matrices}
\beginscroll

\labelSpace{3pc}
\xtc{
Axiom provides both left and right scalar multiplication.
}{
\spadpaste{m := matrix [[1,2],[3,4]] \bound{m}}
}
\xtc{
}{
\spadpaste{4 * m * (-5)\free{m}}
}
\xtc{
You can add, subtract, and multiply matrices provided, of course, that
the matrices have compatible dimensions.
If not, an error message is displayed.
}{
\spadpaste{n := matrix([[1,0,-2],[-3,5,1]]) \bound{n}}
}
\xtc{
This following product is defined but \spad{n * m} is not.
}{
\spadpaste{m * n \free{m n}}
}

The operations \spadfunFrom{nrows}{Matrix} and \spadfunFrom{ncols}{Matrix}
return the number of rows and columns of a matrix.
You can extract a row or a column of a matrix using the operations
\spadfunFrom{row}{Matrix} and \spadfunFrom{column}{Matrix}.
The object returned is a \spadtype{Vector}.
\xtc{
Here is the third column of the matrix \spad{n}.
}{
\spadpaste{vec := column(n,3) \free{n} \bound{vec}}
}
\xtc{

```

You can multiply a matrix on the left by a ‘‘row vector’’ and on the right by a ‘‘column vector.’’

```
{
\spadpaste{vec * m \free{vec m}}
}
\xtc{
Of course, the dimensions of the vector and the matrix must be compatible
or an error message is returned.
}{
\spadpaste{m * vec \free{vec m}}
}
```

The operation `\spadfunFrom{inverse}{Matrix}` computes the inverse of a matrix if

```
{Operations on Matrices}
the matrix is invertible, and returns \spad{"failed"} if not.
\xtc{
This Hilbert matrix is invertible.
}{
\spadpaste{hilb := matrix([[1/(i + j) for i in 1..3] for j in 1..3])
\bound{hilb}}
}
\xtc{
}{
\spadpaste{inverse(hilb) \free{hilb}}
}
\xtc{
This matrix is not invertible.
}{
\spadpaste{mm := matrix([[1,2,3,4], [5,6,7,8], [9,10,11,12],
[13,14,15,16]]) \bound{mm}}
}
\xtc{
}{
\spadpaste{inverse(mm) \free{mm}}
}
```

The operation

```
\spadfunFrom{determinant}{Matrix} computes the determinant of a matrix
{Operations on Matrices}
provided that the entries of the matrix belong to a
\spadtype{CommutativeRing}.
\xtc{
The above matrix \spad{mm} is not invertible and, hence, must have
determinant \spad{0}.
}{
\spadpaste{determinant(mm) \free{mm}}
}
\xtc{
The operation
```

```

\spadfunFrom{trace}{SquareMatrix} computes the trace of a {\em square}
matrix.
{Operations on Matrices}
}{
\spadpaste{trace(mm) \free{mm}}
}

\xtc{
The operation \spadfunFrom{rank}{Matrix} computes the {\it rank} of a
matrix:
the maximal number of linearly independent rows or columns.
}{
\spadpaste{rank(mm) \free{mm}}
}
\xtc{
The operation \spadfunFrom{nullity}{Matrix} computes the {\it nullity} of
a matrix: the dimension of its null space.
}{
\spadpaste{nullity(mm) \free{mm}}
}
\xtc{
The operation \spadfunFrom{nullSpace}{Matrix} returns a list containing
a basis for the null space of a matrix.
Note that the nullity is the number of elements in a basis for the null
space.
}{
\spadpaste{nullSpace(mm) \free{mm}}
}
\xtc{
The operation
\spadfunFrom{rowEchelon}{Matrix} returns the row echelon form of a
{Operations on Matrices}
matrix.
It is easy to see that the rank of this matrix is two and that its nullity
is also two.
}{
\spadpaste{rowEchelon(mm) \free{mm}}
}

MakeFunction

⇒ “notitle” (ugUserMakePage) [10](#) on page [1889](#)
 — mkfunc.ht —

```

\begin{page}{MakeFunctionXmpPage}{MakeFunction}
\beginscroll
It is sometimes useful to be able to define a function given by
the result of a calculation.
%
\xtc{
Suppose that you have obtained the following expression
after several computations
and that you now want to tabulate the numerical values of \spad{f}
for \spad{x} between \spad{-1} and \spad{+1} with increment
\spad{0.1}.
}{
\spadpaste{expr := (x - exp x + 1)**2 * (sin(x**2) * x + 1)**3
\bound{expr}}
}
%
You could, of course, use the function
\spadfunFrom{eval}{Expression} within a loop and evaluate
\spad{expr} twenty-one times, but this would be quite slow.
A better way is to create a numerical function \spad{f} such that
\spad{f(x)} is defined by the expression \spad{expr} above,
but without retyping \spad{expr}!
The package \spadtype{MakeFunction} provides the operation

```

```

\spadfunFrom{function}{MakeFunction} which does exactly this.
%
\xtc{
Issue this to create the function \spad{f(x)} given by \spad{expr}.
}{
\spadpaste{function(expr, f, x) \bound{f}\free{expr}}
}
\xtc{
To tabulate \spad{expr}, we can now quickly evaluate \spad{f} 21 times.
}{
\spadpaste{tbl := [f(0.1 * i - 1) for i in 0..20]; \free{f}\bound{tbl}}
}
%
%
\xtc{
Use the list \spad{[x1,...,xn]} as the
third argument to \spadfunFrom{function}{MakeFunction}
to create a multivariate function \spad{f(x1,...,xn)}.
}{
\spadpaste{e := (x - y + 1)**2 * (x**2 * y + 1)**2 \bound{e}}
}
\xtc{
}{
\spadpaste{function(e, g, [x, y]) \free{e}}
}
%
%
\xtc{
In the case of just two
variables, they can be given as arguments without making them into a list.
}{
\spadpaste{function(e, h, x, y) \free{e}\bound{h}}
}
%
%
\xtc{
Note that the functions created by \spadfunFrom{function}{MakeFunction}
are not limited to floating point numbers, but can be applied to any type
for which they are defined.
}{
\spadpaste{m1 := squareMatrix [[1, 2], [3, 4]] \bound{m1}}
}
\xtc{
}{
\spadpaste{m2 := squareMatrix [[1, 0], [-1, 1]] \bound{m2}}
}
\xtc{
}{
\spadpaste{h(m1, m2) \free{h m1 m2}}
}

```

```

```

\begin{page}{MultivariatePolyXmpPage}{MultivariatePolynomial}
\beginscroll

```

The domain constructor `\spadtype{MultivariatePolynomial}` is similar to

`\spadtype{Polynomial}` except that it specifies the variables to be used.
`\spadtype{Polynomial}` are available for `\spadtype{MultivariatePolynomial}`.
 The abbreviation for `\spadtype{MultivariatePolynomial}` is
`\spadtype{MPOLY}`.

The type expressions

```
\centerline{{\spadtype{MultivariatePolynomial}([x,y],Integer)}}}
```

and

```
\centerline{{\spadtype{MPOLY}([x,y],INT)}}}
```

refer to the domain of multivariate polynomials in the variables

`\spad{x}` and `\spad{y}` where the coefficients are restricted to be integers.

The first

variable specified is the main variable and the display of the polynomial reflects this.

```
\xctc{
```

This polynomial appears with

terms in descending powers of the variable `\spad{x}`.

```
}{
```

```
\spadpaste{m : MPOLY([x,y],INT) := (x**2 - x*y**3 + 3*y)**2 \bound{m}}
```

```
}
```

```
\xctc{
```

It is easy to see a different variable ordering by doing a conversion.

```
}{
```

```
\spadpaste{m :: MPOLY([y,x],INT) \free{m}}
```

```
}
```

```
\xctc{
```

You can use other, unspecified variables, by using

`\spadtype{Polynomial}` in the coefficient type of `\spadtype{MPOLY}`.

```
}{
```

```
\spadpaste{p : MPOLY([x,y],POLY INT) \bound{pdec}}
```

```
}
```

```
\xctc{
```

```
}{
```

```
\spadpaste{p := (a**2*x - b*y**2 + 1)**2 \free{pdec}\bound{p}}
```

```
}
```

```
\xctc{
```

Conversions can be used to re-express such polynomials in terms of the other variables. For example, you can first push all the variables into a polynomial with integer coefficients.

```
}{
```

```
\spadpaste{p :: POLY INT \free{p}\bound{prev}}
```

```
}
```

```
\xctc{
```

Now pull out the variables of interest.

```
}{
```

```
\spadpaste{\% :: MPOLY([a,b],POLY INT) \free{prev}}
```

```
}
```

```
\beginImportant
```

```
\noindent {\bf Restriction:}
```

```
\texht{\begin{quotation}\noindent}{\newline\indent{5}}
```

Axiom does not allow you to create types where
`\spadtype{MultivariatePolynomial}` is contained in the coefficient type of
`\spadtype{Polynomial}`. Therefore,
`\spad{MPOLY}([x,y],POLY INT)` is legal but
`\spad{POLY MPOLY}([x,y],INT)` is not.
`\texht{\end{quotation}}{\indent{0}}`
`\endImportant`

`\xctc{`
 Multivariate polynomials may be combined with univariate polynomials
 to create types with special structures.

`{`
`\spadpaste{q : UP(x, FRAC MPOLY([y,z],INT)) \bound{qdec}}`
`}`

`\xctc{`
 This is a polynomial in `\spad{x}` whose coefficients are
 quotients of polynomials in `\spad{y}` and `\spad{z}`.

`{`
`\spadpaste{q := (x**2 - x*(z+1)/y +2)**2 \free{qdec}\bound{q}}`
`}`

`\xctc{`
 Use conversions for structural rearrangements.
`\spad{z}` does not appear in a denominator and so it can be made
 the main variable.

`{`
`\spadpaste{q :: UP(z, FRAC MPOLY([x,y],INT)) \free{q}}`
`}`

`\xctc{`
 Or you can make a multivariate polynomial in `\spad{x}` and `\spad{z}`
 whose coefficients are fractions in polynomials in `\spad{y}`.

`{`
`\spadpaste{q :: MPOLY([x,z], FRAC UP(y,INT)) \free{q}}`
`}`

A conversion like `\spad{q :: MPOLY([x,y], FRAC UP(z,INT))}` is not
 possible in this example
 because `\spad{y}` appears in the denominator of a fraction.
 As you can see, Axiom provides extraordinary flexibility in the
 manipulation and display of expressions via its conversion facility.

Rational Number

— numbers.ht —

```

\begin{page}{RationalNumberPage}{Rational Numbers}
\begin{scroll}
Like integers, rational numbers can be arbitrarily large.
For example:
\spadpaste{61657 ** 10 / 999983 ** 12}
Rational numbers will not be converted to decimals unless you explicitly
ask Axiom to do so.
To convert a rational number to a decimal, use the function
\spadfun{numeric}.
Here's an example:
\spadpaste{x := 104348/33215 \bound{x}}

```

```

\spadpaste{numeric x \free{x}}
You can find the numerator and denominator of rational numbers using
the functions \spadfun{number} and \spadfun{denom}, respectively.
\spadpaste{number(x) \free{x}}
\spadpaste{denom(x) \free{x}}
To factor the numerator and denominator of a fraction, use the following
command:
\spadpaste{factor(number x) / factor(denom x) \free{x}}

\begin{page}{IntegerPage}{Integers}
\beginscroll
In Axiom, integers can be as large as you like.
Try the following examples:
\spadpaste{x := factorial(200) \bound{x}}
\spadpaste{y := 2**90 - 1 \bound{y}}
Of course, you can now do arithmetic as usual on these (very)
large integers:
\spadpaste{x + y \free{x y}}
\spadpaste{x - y \free{x y}}
\spadpaste{x * y \free{x y}}
```

```

— numbers.ht —

```
\begin{page}{IntegerExamplePage}{Integer Examples}
\beginscroll
One can show that if an integer of the form  $2^{**}k + 1$  is prime, then
 $k$  must be a power of 2.
\downlink{Proof}{IntegerExampleProofPage}
\par
Pierre Fermat conjectured that every integer of the form  $2^{**}(2^{**}n) + 1$ 
is prime.
Let's look for a counterexample.
First define a function:
\spadpaste{f: NNI -> INT \bound{f1}}
\spadpaste{f(n) == 2**(2**n) + 1 \bound{f} \free{f1}}
Now try commands like:
\spadpaste{factor f(1) \free{f}}
\spadpaste{factor f(2) \free{f}}
until you find an integer of this form which is composite.
You can also try the following command:
\spadpaste{for n in 1..6 repeat output factor f(n) \free{f}}
Obviously, Fermat didn't have access to Axiom!

Integer Example Proof

— numbers.ht —

```

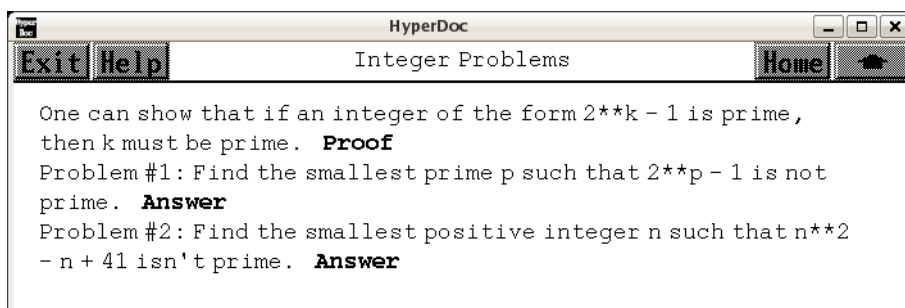

\begin{page}{IntegerExampleProofPage}{Integer Example Proof}
\beginscroll
Proposition.  If  $2**k + 1$  is prime, then  $k$  is a power of 2.
\newline
Proof.  Suppose that  $k = m * n$  with  $m > 1$  odd.  Then
%
```

```

\centerline{ $2^{**n} \equiv -1 \pmod{2^{**n} + 1}$ }
\centerline{ $2^{**n} \equiv (-1)^m \equiv -1 \pmod{2^{**n} + 1}$ }
\centerline{ $2^{**k} + 1 \equiv 0 \pmod{2^{**n} + 1}$ }
%
Therefore,  $2^{**k} + 1$  is divisible by  $2^{**n} + 1$ .
Now  $1 < 2^{**n} + 1$  and since  $m > 1$ ,  $2^{**n} + 1 < 2^{**k} + 1$ .
Hence,  $2^{**k} + 1$  has a non-trivial factor.

Solution to Problem #1

— numbers.ht —

```
\begin{page}{IntegerProblemAnswerPage1}{Solution to Problem \#1}
\beginscroll
Problem \#1: Find the smallest prime  $p$  such that  $2^{**p} - 1$ 
is not prime.
\newline
First, define a function:
\spadpaste{f: NNI -> INT \bound{f1}}
\spadpaste{f(n) == 2**n - 1 \bound{f} \free{f1}}
You can try factoring  $f(p)$  as  $p$  ranges through the set of primes.
For example,
\spadpaste{factor f(7) \free{f}}
```

This gets tedious after a while, so let's use Axiom's stream facility. (A stream is essentially an infinite sequence.)

\newline

First, we create a stream consisting of the positive integers:

```
\spadpaste{ints := [n for n in 1..] \bound{ints}}
```

Now, we create a stream consisting of the primes:

```
\spadpaste{primes := [x for x in ints | prime? x] \bound{primes}
\free{ints}}
```

Here's the 25th prime:

```
\spadpaste{primes.25 \free{primes}}
```

Next, create the stream of numbers of the form $2^*p - 1$ with p prime:

```
\spadpaste{numbers := [f(n) for n in primes] \bound{numbers} \free{primes f}}
```

Finally, form

the stream of factorizations of the elements of \spad{numbers}:

```
\spadpaste{factors := [factor n for n in numbers] \bound{factors}
\free{numbers}}
```

You can see that the fifth number in the stream ($2047 = 23 \cdot 89$)

is the first one that has a non-trivial factorization.

Since $2^{11} = 2048$, the solution to the problem is 11.

\newline

Here's another way to see that 2047 is the first number in the stream that is composite:

```
\spadpaste{nums := [x for x in numbers | not prime? x] \bound{nums}
\free{numbers}}
```

Solution to Problem #2

— numbers.ht —

```

\begin{page}{IntegerProblemAnswerPage2}{Solution to Problem \#2}
\beginscroll
Problem \#2: Find the smallest positive integer n such that
\spad{n**2 - n + 41} is not prime.
\newline
When n = 41, n**2 - n + 41 = 41**2, which certainly isn't prime.
Let's see if any smaller integer works.
Here are the first 40 values:
\spadpaste{numbers := [n**2 - n + 41 for n in 0..40] \bound{numbers}}
Now have Axiom factor the numbers on this list:
\spadpaste{[factor n for n in numbers] \free{numbers}}
You can see that 41 is the smallest positive integer n such that
n**n - n + 41 is not prime.

\beginscroll
The Octonions, also called the Cayley-Dixon algebra, defined over a
commutative ring are an eight-dimensional non-associative algebra.
Their construction from quaternions is similar to the construction
of quaternions from complex numbers
(see \downlink{'Quaternion'}{QuaternionXmpPage}\ignore{Quaternion}).
%
\xtc{
As \spadtype{Octonion} creates an eight-dimensional algebra, you have to
give eight components to construct an octonion.
}{
\spadpaste{oci1 := octon(1,2,3,4,5,6,7,8) \bound{oci1}}
}
\xtc{
}{
\spadpaste{oci2 := octon(7,2,3,-4,5,6,-7,0) \bound{oci2}}
}
%

```

```

%
\xtc{
Or you can use two quaternions to create an octonion.
}{
\spadpaste{oci3 := octon(quatern(-7,-12,3,-10), quatern(5,6,9,0))
\bound{oci3}}
}
%
%
\xtc{
You can easily demonstrate the non-associativity of multiplication.
}{
\spadpaste{(oci1 * oci2) * oci3 - oci1 * (oci2 * oci3)
\free{oci1 oci2 oci3}}
}
%
As with the quaternions, we have a real part, the imaginary
parts \spad{i}, \spad{j}, \spad{k}, and four
additional imaginary parts \spad{E}, \spad{I}, \spad{J} and \spad{K}.
These parts correspond to the canonical basis
\spad{(1,i,j,k,E,I,J,K)}.
\xtc{
For each basis element there is a component operation to extract
the coefficient of the basis element for a given octonion.

imagI oci1, imagJ oci1, imagK oci1] \free{oci1}}
}
%
A basis with respect to the
quaternions is given by \spad{(1,E)}.
However, you might ask, what then are the commuting rules?
To answer this, we create some generic elements.
%
\xtc{
We do this in Axiom
by simply changing the ground ring from \spadtype{Integer} to
\spadtype{Polynomial Integer}.
}{
\spadpaste{q : Quaternion Polynomial Integer := quatern(q1, qi, qj, qk)
\bound{q}}
}

```

```

\xtc{
}{
\spadpaste{E : Octonion Polynomial Integer:= octon(0,0,0,0,1,0,0,0)
\bound{E}}
}
%
\xtc{
Note that quaternions are automatically converted to octonions in the
obvious way.
}{
\spadpaste{q * E \free{q E}}
}
\xtc{

OrderlyDifferentialPolynomial

— odpol.ht —

```

\begin{page}{OrderlyDifferentialPolyXmpPage}
{OrderlyDifferentialPolynomial}
\beginscroll

```

Many systems of differential equations may be transformed to equivalent systems of ordinary differential equations where the equations are expressed polynomially in terms of the unknown functions. In Axiom, the domain constructors `\spadtype{OrderlyDifferentialPolynomial}` (abbreviated `\spadtype{ODPOL}`) and `\spadtype{SequentialDifferentialPolynomial}` (abbreviation `\spadtype{SDPOL}`) implement two domains of ordinary differential polynomials over any differential ring. In the simplest case, this differential ring is usually either the ring of integers, or the field of rational numbers. However, Axiom can handle ordinary differential polynomials over a field of rational functions in a single indeterminate.

The two domains `\spadtype{ODPOL}` and `\spadtype{SDPOL}` are almost identical, the only difference being the choice of a different ranking, which is an ordering of the derivatives of the indeterminates. The first domain uses an orderly ranking, that is, derivatives of higher order are ranked higher, and derivatives of the same order are ranked alphabetically. The second domain uses a sequential ranking, where derivatives are ordered first alphabetically by the differential indeterminates, and then by order. A more general domain constructor, `\spadtype{DifferentialSparseMultivariatePolynomial}` (abbreviation `\spadtype{DSMP}`) allows both a user-provided list of differential indeterminates as well as a user-defined ranking. We shall illustrate `\spadtype{ODPOL(FRAC INT)}`, which constructs a domain of ordinary differential polynomials in an arbitrary number of differential indeterminates with rational numbers as coefficients. `\xtc{ }{ \spadpaste{dpol:= ODPOL(FRAC INT) \bound{dpol}} }`

```
\xtc{
A differential indeterminate \spad{w} may be viewed as an infinite
sequence of algebraic indeterminates, which are the derivatives of
\spad{w}.
To facilitate referencing these, Axiom provides the operation
\spadfunFrom{makeVariable}{OrderlyDifferentialPolynomial} to convert an
element of type \spadtype{Symbol} to a map from the natural numbers to the
differential polynomial ring.
}{

\spadpaste{weights(g) \free{g}}
}
\xtc{
}{
\spadpaste{weights(g, 'w) \free{g}}
}
\xtc{
The operation \spadfunFrom{weight}{OrderlyDifferentialPolynomial} returns
the maximum weight of all differential monomials appearing in the
differential polynomial.
}{
\spadpaste{weight(g) \free{g}}
}
\xtc{
A differential polynomial is {\em isobaric} if the weights of all
differential monomials appearing in it are equal.
}{
\spadpaste{isobaric?(g) \free{g}}
}

```

```

}
\xtc{
To substitute {\em differentially}, use
\spadfunFrom{eval}{OrderlyDifferentialPolynomial}. Note that we must
coerce \spad{w} to \spadtype{Symbol}, since in \spadtype{ODPOL},
differential indeterminates belong to the domain \spadtype{Symbol}.
Compare this result to the next, which substitutes {\em algebraically}
(no substitution is done since \spad{w.0} does not appear in \spad{g}).
}{
\spadpaste{eval(g,['w::Symbol],[f]) \free{f}\free{g}}
}
\xtc{
}{
\spadpaste{eval(g,variables(w.0),[f]) \free{f}\free{g}}
}
\xtc{
Since \spadtype{OrderlyDifferentialPolynomial} belongs to
\spadtype{PolynomialCategory}, all the operations defined in the latter
category, or in packages for the latter category, are available.
}{
\spadpaste{monomials(g) \free{g}}
}
\xtc{
}{
\spadpaste{variables(g) \free{g}}

}{
\spadpaste{gcd(f,g) \free{f}\free{g}}
}
\xtc{
}{
\spadpaste{groebner([f,g]) \free{f}\free{g}}
}
\xtc{
The next three operations are essential for elimination procedures in
differential polynomial rings.
The operation \spadfunFrom{leader}{OrderlyDifferentialPolynomial} returns
the leader of a differential polynomial, which is the highest ranked
derivative of the differential indeterminates that occurs.
}{
\spadpaste{lg:=leader(g) \free{g}\bound{lg}}
}
\xtc{
The operation \spadfunFrom{separant}{OrderlyDifferentialPolynomial}
returns the separant of a differential polynomial, which is the
partial derivative with respect to the leader.
}{
\spadpaste{sg:=separant(g) \free{g}\bound{sg}}
}

```

```

\xtc{
The operation \spadfunFrom{initial}{OrderlyDifferentialPolynomial}
returns the initial, which is the leading coefficient when the given
differential polynomial is expressed as a polynomial in the leader.
}{
\spadpaste{ig:=initial(g) \free{g}\bound{ig}}
}
\xtc{
Using these three operations, it is possible to reduce \spad{f} modulo
the differential ideal generated by \spad{g}. The general scheme is
to first reduce the order, then reduce the degree in the leader.
First, eliminate \spad{z.3} using the derivative of \spad{g}.
}{
\spadpaste{g1 := D g \free{g}\bound{g1}}
}
\xtc{
Find its leader.
}{
\spadpaste{lg1:= leader g1 \free{g1}\bound{lg1}}
}
\xtc{
Differentiate \spad{f} partially with respect to this leader.
}{
\spadpaste{pdf:=D(f, lg1) \free{f}\free{lg1}\bound{pdf}}
}
\xtc{
Compute the partial remainder of \spad{f} with respect to \spad{g}.
}{
\spadpaste{prf:=sg * f- pdf * g1 \free{f}\free{sg}\free{pdf}
\free{g1}\bound{prf}}
}
\xtc{
Note that high powers of \spad{lg} still appear in \spad{prf}.
Compute the leading coefficient of \spad{prf}
as a polynomial in the leader of \spad{g}.
}{
\spadpaste{lcf:=leadingCoefficient univariate(prf, lg)
\free{prf}\free{lg}\bound{lcf}}
}
\xtc{
Finally, continue eliminating the high powers of \spad{lg} appearing in
\spad{prf} to obtain the (pseudo) remainder of \spad{f} modulo \spad{g}
and its derivatives.
}{
\spadpaste{ig * prf - lcf * g * lg \free{ig}\free{prf}
\free{lcf}\free{g}\free{lg}}

3.83 op.ht

Operator

— op.ht —

```

\begin{page}{OperatorXmpPage}{Operator}
\begin{scroll}
Given any ring \spad{R}, the ring of the \spadtype{Integer}-linear
operators over \spad{R} is called \spadtype{Operator(R)}. To create
an operator over \spad{R}, first create a basic operator using the
operation \spadfun{operator}, and then convert it to
\spadtype{Operator(R)} for the \spad{R} you want.
%
\xtc{

```

We choose $\text{\spad{R}}$ to be the two by two matrices over the integers.

```

}{
\spadpaste{R := SQMATRIX(2, INT)\bound{r}}
}
\xtc{
Create the operator \spad{tilde} on \spad{R}.
}{
\spadpaste{t := operator("tilde") :: OP(R) \free{r}\bound{t}}
}
%
Since \spadtype{Operator} is unexposed we must either package-call
operations from it, or expose it explicitly. For convenience we will
do the latter.
%
\noOutputXtc{
Expose \spad{Operator}.
}{
\spadpaste{set expose add constructor Operator \free{t}\bound{expose}}
}
%
To attach an evaluation function (from \spad{R} to \spad{R}) to an
operator over \spad{R}, use \spad{evaluate(op, f)} where \spad{op}
is an operator over \spad{R} and \spad{f} is a function \spad{R ->
R}.
This needs to be done only once when the operator is defined.
Note that \spad{f} must be \spadtype{Integer}-linear (that is,
\spad{f(ax+y) = a f(x) + f(y)} for any integer \spad{a}, and any
\spad{x} and \spad{y} in \spad{R}).
%
\xtc{
We now attach the transpose map to the above operator \spad{t}.
}{
\spadpaste{evaluate(t, m +-> transpose m)\free{expose}\free{t}\bound{evt}}
}
%
Operators can be manipulated formally as in any ring: \spadop{+} is the
pointwise addition and \spadop{*} is composition.
Any element \spad{x} of \spad{R} can be converted to an operator
\subscriptText{\tt op}{\tt x}
over \spad{R}, and the evaluation function of
\subscriptText{\tt op}{\tt x}
is left-multiplication by \spad{x}.
%
\xtc{
Multiplying on the
left by this matrix swaps the two rows.
}{
\spadpaste{s : R := matrix [[0, 1], [1, 0]]\bound{s}}
}
%

```

```

\xtc{
Can you guess what is the action of the following operator?
}{
\spadpaste{rho := t * s\free{evt s}\bound{rho}}
}
%
%
\xtc{
Hint: applying \spad{rho} four times gives the identity, so
\spad{rho**4-1} should return 0 when applied to any two by two matrix.
}{
\spadpaste{z := rho**4 - 1\free{rho}\bound{z}}
}
%
%
\xtc{
Now check with this matrix.
}{
\spadpaste{m:R := matrix [[1, 2], [3, 4]]\bound{m}}
}
\xtc{
}{
\spadpaste{z m\free{z m}}
}
%
%
\xtc{
As you have probably guessed by now, \spad{rho} acts on matrices
by rotating the elements clockwise.
}{
\spadpaste{rho m\free{rho m}}
}
\xtc{
}{
\spadpaste{rho rho m\free{rho m}}
}
\xtc{
}{
\spadpaste{(rho**3) m\free{rho m}}
}
%
%
\xtc{
Do the swapping of rows and transposition commute?
We can check by computing their bracket.
}{
\spadpaste{b := t * s - s * t\free{s evt}\bound{b}}
}
%
%

```

```

\xtc{
Now apply it to \spad{m}.
}{
\spadpaste{b m \free{b m}}
}
%

Next we demonstrate how to define a differential operator
on a polynomial ring.
\xtc{
This is the recursive definition of the \spad{n}-th Legendre polynomial.
}{
\begin{spadsrc}[\bound{1}]
L n ==
  n = 0 => 1
  n = 1 => x
  (2*n-1)/n * x * L(n-1) - (n-1)/n * L(n-2)
\end{spadsrc}
}
\xtc{
Create the differential operator \texht{$d \over {dx}$}\spad{d/dx} on
polynomials in \spad{x} over the rational numbers.
}{
\spadpaste{dx := operator("D") :: OP(POLY FRAC INT) \bound{dx}}
}
\xtc{
Now attach the map to it.
}{
\spadpaste{evaluate(dx, p +-> D(p, 'x)) \free{dx}\bound{edx}}
}
\xtc{
This is the differential equation satisfied by the \spad{n}-th
Legendre polynomial.
}{
\spadpaste{E n == (1 - x**2) * dx**2 - 2 * x * dx + n*(n+1)
\free{edx}\bound{E}}
}
\xtc{
Now we verify this for \spad{n = 15}.
Here is the polynomial.
}{
\spadpaste{L 15 \free{L}}
}
\xtc{
Here is the operator.
}{
\spadpaste{E 15 \free{E}}
}
\xtc{
Here is the evaluation.

```

```

}{
\spadpaste{(E 15)(L 15) \free{L E}}
}
\endscroll

3.85 perman.ht

Permanent

— perman.ht —

```

\begin{page}{PermanentXmpPage}{Permanent}
\begin{scroll}
The package \spadtype{Permanent} provides the function
\spadfunFrom{permanent}{Permanent} for square matrices.
The \spadfunFrom{permanent}{Permanent} of a square matrix can be computed
in the same way as the determinant by expansion of minors except that for
the permanent the sign for each element is \spad{1}, rather than being
\spad{1} if the row plus column indices is positive and \spad{-1}
otherwise.
This function is much more difficult to compute efficiently than the
\spadfunFrom{determinant}{Matrix}.
An example of the use of \spadfunFrom{permanent}{Permanent} is the
calculation of the \eth{\spad{n}} derangement number, defined to be
the number of different possibilities for \spad{n} couples to dance
but never with their own spouse.
\xtc{
Consider an \spad{n} by \spad{n} matrix with entries
\spad{0} on the diagonal and
\spad{1} elsewhere.
Think of the rows as one-half of each couple (for example, the males)
and the columns the other half. The permanent of such a matrix gives
the desired derangement number.
}{

PartialFraction

⇐ “Axiom Number Types” (NumberPage) 3.80 on page 1021

⇒ “FullPartialFracExpansion” (FullPartialFracExpansionXmpPage) 3.46 on page 549

— pfr.ht —

```
\begin{page}{PartialFractionXmpPage}{PartialFraction}
\beginscroll
A {\it partial fraction} is a decomposition of a quotient into a sum
of quotients where the denominators of the summands are powers of
primes.\footnote{Most people first encounter partial fractions when
they are learning integral calculus. For a technical discussion of
partial fractions, see, for example, Lang's {\it Algebra.}} For
example, the rational number \spad{1/6} is decomposed into
\spad{1/2-1/3}. You can compute partial fractions of quotients of
objects from domains belonging to the category
\spadtype{EuclideanDomain}. For
example, \spadtype{Integer}, \spadtype{Complex Integer}, and
\spadtype{UnivariatePolynomial(x, Fraction Integer)} all belong to
\spadtype{EuclideanDomain}. In the examples following, we demonstrate
how to decompose quotients of each of these kinds of object into
partial fractions. Issue the system command \spadcmd{)show
PartialFraction} to display the full list of operations defined by
\spadtype{PartialFraction}.
```

It is necessary that we know how to factor the denominator when we want to compute a partial fraction. Although the interpreter can often do this automatically, it may be necessary for you to include a call to `\spadfun{factor}`. In these examples, it is not necessary to factor the denominators explicitly.

```
%
\xtc{
The main operation for computing partial fractions is called
\spadfunFrom{partialFraction}{PartialFraction} and we use this to
compute a decomposition of \spad{1 / 10!}.
The first argument to \spadfunFrom{partialFraction}{PartialFraction} is
the numerator of the quotient and the second argument is the factored
denominator.
}{
\spadpaste{partialFraction(1,factorial 10) \bound{prev1}}
}
\xtc{
Since the denominators are powers of primes, it may be possible
to expand the numerators further with respect to those primes. Use the
operation \spadfunFrom{padicFraction}{PartialFraction} to do this.
}{
\spadpaste{f := padicFraction(\%) \free{prev1}\bound{f}}
}
%
%
\xtc{
The operation \spadfunFrom{compactFraction}{PartialFraction} returns an
expanded fraction into the usual form.
The compacted version is used internally for computational efficiency.
}{
\spadpaste{compactFraction(f) \free{f}}
}
%
\xtc{
You can add, subtract, multiply
and divide partial fractions. In addition, you can extract the parts
of the decomposition.
\spadfunFrom{numberOfFractionalTerms}{PartialFraction} computes
the number of terms in the fractional part.
This does not include the whole part of the fraction,
which you get by calling \spadfunFrom{wholePart}{PartialFraction}.
In this example, the whole part is just \spad{0}.
}{
\spadpaste{numberOfFractionalTerms(f) \free{f}}
}
\xtc{
The operation \spadfunFrom{nthFractionalTerm}{PartialFraction} returns
the individual terms in the decomposition. Notice that the object
returned is a partial fraction itself.
\spadfunFrom{firstNumerator}{PartialFraction} and
```

```

\spadfunFrom{firstDenom}{PartialFraction} extract the numerator and
denominator of the first term of the fraction.
}{
\spadpaste{nthFractionalTerm(f,3) \free{f}}
}
%

%
\xtc{
Given two gaussian integers (see
\downlink{Complex}{ComplexXmpPage}\ignore{Complex}), you can
decompose their quotient into a partial fraction.
}{
\spadpaste{partialFraction(1,- 13 + 14 * \%i) \bound{prev2}}
}
%
\xtc{
To convert back to a quotient, simply use a conversion.
}{
\spadpaste{\% :: Fraction Complex Integer \free{prev2}}
}

To conclude this section, we compute the decomposition of
\texht{\narrowDisplay{1 \over {(x + 1)}{(x + 2)}^2{(x + 3)}^3{(x + 4)}^4}}{
\begin{verbatim}
      1
-----
      2      3      4
(x + 1)(x + 2) (x + 3) (x + 4)
\end{verbatim}
}
The polynomials in this object have type
\spadtype{UnivariatePolynomial(x, Fraction Integer)}.
%
\xtc{
We use the \spadfunFrom{primeFactor}{Factored} operation (see
\downlink{Factored}{FactoredXmpPage}
\ignore{Factored}) to create the denominator in factored form directly.
}{
\spadpaste{u : FR UP(x, FRAC INT) := reduce(*,[primeFactor(x+i,i)
for i in 1..4]) \bound{u}}
}
%
%
\xtc{
These are the compact and expanded partial fractions for the quotient.
}{
\spadpaste{partialFraction(1,u) \free{u}\bound{prev3}}
}
\xtc{

```

```

}{
\spadpaste{padicFraction \% \free{prev3}}
}

All see \downlink{'FullPartialFracExpansion'}
{FullPartialFracExpansionXmpPage}
\ignore{FullPartialFracExpansion} for examples of
factor-free conversion of quotients to full partial fractions.

Basic Operations On Polynomials

— poly.ht —

```
\begin{page}{PolynomialBasicPage}{Basic Operations On Polynomials}
\beginscroll
You create
polynomials using the usual operations of \spadopFrom{+}{Polynomial},
\spadopFrom{-}{Polynomial}, \spadopFrom{*}{Polynomial}
(for multiplication), and
\spadopFrom{**}{Polynomial} (for exponentiation).
Here are two examples: \newline
\spadpaste{p := a*x**2 + b*x*y + c*y**2 \bound{p}}
\spadpaste{q := 13*x**2 + 3*z \bound{q}}
These operations can also be used to combine polynomials.
Try the following:
\spadpaste{p + q \free{p q}}
\spadpaste{p - 3*q \free{p q}}
\spadpaste{p**2 + p*q \free{p q}}
\spadpaste{r := (p + q)**2 \bound{r} \free{p q}}
As you can see from the above examples, the variables are ordered
by defaults \spad{z > y > x > c > b > a},
that is, \spad{z} is the main variable, then
\spad{y} and so on in reverse alphabetical order.
You can redefine this
ordering (for display purposes only) with the \spadfun{setVariableOrder}
command.
For example, the following
makes \spad{a} the main variable, then \spad{b}, and so on:
\spadpaste{setVariableOrder [a,b,c,x,y,z] \bound{vord}}
Now compare the way polynomials are displayed:
\spadpaste{p \free{p vord}}
\spadpaste{q \free{q vord}}
\spadpaste{r \free{r vord}}
To return to the system's default ordering,
```

```

use \spadfun{resetVariableOrder}.
\spadpaste{resetVariableOrder() \bound{rvord}}
\spadpaste{p \free{p rvord}}
Polynomial coefficients can be pulled out
using the function \spadfun{coefficient}. \newline
For example:
\spadpaste{coefficient(q,x,2) \free{q}}
will give you the coefficient of \spad{x**2} in the polynomial \spad{q}.
\newline
Try these commands:
\spadpaste{coefficient(r,x,3) \free{r}}
\spadpaste{c := coefficient(r,z,1) \free{r} \bound{c}}
\spadpaste{coefficient(c,x,2) \free{c}}
Coefficients of monomials can be obtained as follows:
\spadpaste{coefficient(q**2, [x,z], [2,1]) \free{q}}
This will return the coefficient of x**2 * z in the polynomial q**2.
Also,
\spadpaste{coefficient(r, [x,y], [2,2]) \free{r}}
will return the coefficient of \spad{x**2 * y**2}
in the polynomial \spad{r(x,y)}.

Polynomial Evaluation and Substitution

— poly.ht —

```
\begin{page}{PolynomialSubstitutionPage}
```

```

{Polynomial Evaluation and Substitution}
\beginscroll
The function \spadfun{eval} is used to substitute values into polynomials.
Here's an example of how to use it:
\spadpaste{p := x**2 + y**2 \bound{p}}
\spadpaste{eval(p,x=5) \free{p}}
\newline
This example would give you the value of the polynomial \spad{p} at 5.
You can also substitute into polynomials with
several variables. First, specify the polynomial, then give
a list of bindings of the form \spad{variable = value}. For example:
\spadpaste{eval(p,[x = a + b,y = c + d]) \free{p}}
Here \spad{x} was replaced by \spad{a + b},
and \spad{y} was replaced by \spad{c + d}.
Here's another example:
\spadpaste{q := x**3 + 5*x - y**4 \bound{q}}
\spadpaste{eval(q,[x=y,y=x]) \free{q}}
Substitution is done "in parallel."
That is, Axiom takes
\spad{q(x,y)} and returns \spad{q(y,x)}.
\newline
You can also substitute numerical values for some or all of the
variables:
\spadpaste{px := eval(p, y = sin(2.0)) \bound{px} \free{p}}
\spadpaste{eval(px, x = cos(2.0)) \free{px}}

```

Greatest Common Divisors, Resultants, and Discriminants

— poly.ht —

```

\begin{page}{PolynomialGCDPage}
{Greatest Common Divisors, Resultants, and Discriminants}
\beginscroll
You can compute the greatest common divisor of two polynomials using
the function \spadfun{gcd}.
Here's an example:
\spadpaste{p := 3*x**8 + 2*x**7 + 6*x**2 + 7*x + 2 \bound{p}}
\spadpaste{q := 2*x**13 + 9*x**7 + 2*x**6 + 10*x + 5 \bound{q}}
\spadpaste{gcd(p,q) \free{p q}}
You could also see that \spad{p} and \spad{q} have a factor in
common by using the function \spadfun{resultant}:
\spadpaste{resultant(p,q,x) \free{p q}}
The resultant of two polynomials vanishes precisely when they have a
factor in common.
(In the example above
we specified the variable with
which we wanted to compute the resultant because the
polynomials could have involved variables other than x.)

— poly1.ht —

```
\begin{page}{PolynomialXmpPage}{Polynomial}
\beginscroll

The domain constructor \spadtype{Polynomial}
(abbreviation: \spadtype{POLY})
```

provides polynomials with an arbitrary number of unspecified variables.

```
\xctc{
It is used to create the default polynomial domains
in Axiom.
Here the coefficients are integers.
}{
\spadpaste{x + 1}
}
\xctc{
Here the coefficients have type \spadtype{Float}.
}{
\spadpaste{z - 2.3}
}
\xctc{
And here we have a polynomial in two variables with coefficients
which have type \spadtype{Fraction Integer}.
}{
\spadpaste{y**2 - z + 3/4}
}
```

The representation of objects of domains created by `\spadtype{Polynomial}` is that of recursive univariate polynomials.^{\footnote{The term `\spad{univariate}` means ‘‘one variable.’’ `\spad{multivariate}` means ‘‘possibly more than one variable.’’}}

```
\xctc{
This recursive structure is sometimes obvious from the display of
a polynomial.
}{
\spadpaste{y **2 + x*y + y \bound{prev}}
}
In this example, you see that the polynomial is stored as a polynomial in
\spad{y} with coefficients that are polynomials in \spad{x} with integer
coefficients.
In fact, you really don't need to worry about the representation unless
you are working on an advanced application where it is critical.
The polynomial types created from
\spadtype{DistributedMultivariatePoly} and
\spadtype{NewDistributedMultivariatePoly} (discussed in
\downlink{‘DistributedMultivariatePoly’}
{DistributedMultivariatePolyXmpPage}
\ignore{DistributedMultivariatePoly}) are stored and displayed in a
non-recursive manner.
\xctc{
You see a ‘‘flat’’ display of the above
polynomial by converting to one of those types.
}{
\spadpaste{\% :: DMP([y,x],INT) \free{prev}}
}
```

We will demonstrate many of the polynomial facilities by using two polynomials with integer coefficients.

```
\xctc{
By default, the interpreter expands polynomial expressions, even if they
are written in a factored format.
```

```
}{
\spadpaste{p := (y-1)**2 * x * z \bound{p}}
}
```

```
\xctc{
See \downlink{‘Factored’}{FactoredXmpPage}\ignore{Factored} to see
how to create objects in factored form directly.
```

```
}{
\spadpaste{q := (y-1) * x * (z+5) \bound{q}}
}
```

```
\xctc{
The fully factored form can be recovered by using
\spadfunFrom{factor}{Polynomial}.
```

```
}{
\spadpaste{factor(q) \free{q}}
}
```

This is the same name used for the operation to factor integers. Such reuse of names is called `\spadglos{overloading}` and makes it much easier to think of solving problems in general ways. Axiom facilities for factoring polynomials created with `\spadtype{Polynomial}` are currently restricted to the integer and rational number coefficient cases. There are more complete facilities for factoring univariate polynomials: see

`\downlink{‘Polynomial Factorization’}{ugProblemFactorPage}` in Section 8.2`\ignore{ugProblemFactor}`.

```
\xctc{
The standard arithmetic operations are available for polynomials.
```

```
}{
\spadpaste{p - q**2\free{p q}}
}
```

```
\xctc{
The operation \spadfunFrom{gcd}{Polynomial} is used to compute the
greatest common divisor of two polynomials.
```

```
}{
\spadpaste{gcd(p,q) \free{p q}\bound{prev4}}
}
```

```
\xctc{
In the case of \spad{p} and \spad{q}, the gcd is obvious from their
definitions.
```

We factor the gcd to show this relationship better.

```
}{
\spadpaste{factor \% \free{prev4}}
}
```

```
\xctc{
```

The least common multiple is computed by using

```
\spadfunFrom{lcm}{Polynomial}.
```

```
}{
```

```
\spadpaste{lcm(p,q) \free{p q}}
```

```
}
```

```
\xtc{
```

Use `\spadfunFrom{content}{Polynomial}` to compute the

greatest common divisor of the

coefficients of the polynomial.

```
}{
```

```
\spadpaste{content p \free{p}}
```

```
}
```

Many of the operations on polynomials require you to specify a variable.

For example, `\spadfunFrom{resultant}{Polynomial}` requires you to give the

variable in which the polynomials should be expressed.

```
\xtc{
```

This computes the resultant of the values of `\spad{p}` and

`\spad{q}`, considering them as polynomials in the variable `\spad{z}`.

They do not share a root when thought of as polynomials in `\spad{z}`.

```
}{
```

```
\spadpaste{resultant(p,q,z) \free{p q}}
```

```
}
```

```
\xtc{
```

This value is `\spad{0}` because as polynomials in `\spad{x}` the polynomials

have a common root.

```
}{
```

```
\spadpaste{resultant(p,q,x) \free{p}\free{q}}
```

```
}
```

The data type used for the variables created by `\spadtype{Polynomial}` is

`\spadtype{Symbol}`.

As mentioned above, the representation used by `\spadtype{Polynomial}` is

recursive and so there is a main variable for nonconstant polynomials.

```
\xtc{
```

The operation `\spadfunFrom{mainVariable}{Polynomial}` returns this variable.

The return type is actually a union of `\spadtype{Symbol}` and

`\spad{"failed"}`.

```
}{
```

```
\spadpaste{mainVariable p \free{p}}
```

```
}
```

```
\xtc{
```

The latter branch of the union is be used if the polynomial has no

variables, that is, is a constant.

```
}{
```

```
\spadpaste{mainVariable(1 :: POLY INT)}
```

```
}
```

```
\xtc{
```

You can also use the predicate `\spadfunFrom{ground?}{Polynomial}` to test

whether a polynomial is in fact a member of its ground ring.

```

}{
\spadpaste{ground? p \free{p}}
}
\xtc{
}{
\spadpaste{ground?(1 :: POLY INT)}
}
\xtc{
The complete list of variables actually used in a particular polynomial is
returned by \spadfunFrom{variables}{Polynomial}.
For constant polynomials, this list is empty.
}{
\spadpaste{variables p \free{p}}
}

\xtc{
The \spadfunFrom{degree}{Polynomial} operation returns the
degree of a polynomial in a specific variable.
}{
\spadpaste{degree(p,x) \free{p}}
}
\xtc{
}{
\spadpaste{degree(p,y) \free{p}}
}
\xtc{
}{
\spadpaste{degree(p,z) \free{p}}
}
\xtc{
If you give a list of variables for the second argument, a list
of the degrees in those variables is returned.
}{
\spadpaste{degree(p,[x,y,z]) \free{p}}
}
\xtc{
The minimum degree of a variable in a polynomial is computed using
\spadfunFrom{minimumDegree}{Polynomial}.
}{
\spadpaste{minimumDegree(p,z) \free{p}}
}
\xtc{
The total degree of a polynomial is returned by
\spadfunFrom{totalDegree}{Polynomial}.
}{
\spadpaste{totalDegree p \free{p}}
}

\xtc{
It is often convenient to think of a polynomial as a leading monomial

```

```

plus the remaining terms.
}{
\spadpaste{leadingMonomial p \free{p}}
}
\xtc{
The \spadfunFrom{reductum}{Polynomial} operation returns a polynomial
consisting of the sum of the monomials after the first.
}{
\spadpaste{reductum p \free{p}}
}
\xtc{
These have the obvious relationship that the original polynomial
is equal to the leading monomial plus the reductum.
}{
\spadpaste{p - leadingMonomial p - reductum p \free{p}}
}
\xtc{
The value returned by \spadfunFrom{leadingMonomial}{Polynomial} includes
the coefficient of that term.
This is extracted by using
\spadfunFrom{leadingCoefficient}{Polynomial} on the original polynomial.
}{
\spadpaste{leadingCoefficient p \free{p}}
}
\xtc{
The operation \spadfunFrom{eval}{Polynomial} is used to substitute a
value for a variable in a polynomial.
}{
\spadpaste{p \free{p}}
}
\xtc{
This value may be another variable, a constant or a polynomial.
}{
\spadpaste{eval(p,x,w) \free{p}}
}
\xtc{
}{
\spadpaste{eval(p,x,1) \free{p}}
}
\xtc{
Actually, all the things being substituted are just polynomials,
some more trivial than others.
}{
\spadpaste{eval(p,x,y**2 - 1) \free{p}}
}

\xtc{
Derivatives are computed using the \spadfunFrom{D}{Polynomial}
operation.
}{

```

```

\spadpaste{D(p,x) \free{p}}
}
\xtc{
The first argument is the polynomial and the second is the variable.
}{
\spadpaste{D(p,y) \free{p}}
}
\xtc{
Even if the polynomial has only one variable, you must specify it.
}{
\spadpaste{D(p,z) \free{p}}
}

```

Integration of polynomials is similar and the
`\spadfunFrom{integrate}{Polynomial}` operation is used.

```

\xtc{
Integration requires that the coefficients support division.
Consequently,
Axiom converts polynomials over the integers to polynomials over
the rational numbers before integrating them.
}{
\spadpaste{integrate(p,y) \free{p}}
}

```

It is not possible, in general, to divide two polynomials.
 In our example using polynomials over the integers, the operation
`\spadfunFrom{monicDivide}{Polynomial}` divides a polynomial by a monic
 polynomial (that is, a polynomial with leading coefficient equal to 1).
 The result is a record of the quotient and remainder of the
 division.

```

\xtc{
You must specify the variable in which to express the polynomial.
}{
\spadpaste{qr := monicDivide(p,x+1,x) \free{p}\bound{qr}}
}
\xtc{
The selectors of the components of the record are
\spad{quotient} and \spad{remainder}.
Issue this to extract the remainder.
}{
\spadpaste{qr.remainder \free{qr}}
}
\xtc{
Now that we can extract the components, we can demonstrate the
relationship among them and the arguments to our original expression
\spad{qr := monicDivide(p,x+1,x)}.
}{
\spadpaste{p - ((x+1) * qr.quotient + qr.remainder) \free{p}\free{qr}}
}

```

```

\xtc{
If the \spadopFrom{/}{Fraction} operator is used with polynomials, a
fraction object is created.
In this example, the result is an object of type \spadtype{Fraction
Polynomial Integer}.
}{
\spadpaste{p/q \free{p}\free{q}}
}
\xtc{
If you use rational numbers as polynomial coefficients, the
resulting object is of type \spadtype{Polynomial Fraction Integer}.
}{
\spadpaste{(2/3) * x**2 - y + 4/5 \bound{prev1}}
}
\xtc{
This can be converted to a fraction of polynomials and back again, if
required.
}{
\spadpaste{\% :: FRAC POLY INT \free{prev1}\bound{prev2}}
}
\xtc{
}{
\spadpaste{\% :: POLY FRAC INT \free{prev2}\bound{prev3}}
}
\xtc{
To convert the coefficients to floating point,
map the \spadfun{numeric} operation on the coefficients of the polynomial.
}{
\spadpaste{map(numeric,\%) \free{prev3}}
}

— quat.ht —

```
\begin{page}{QuaternionXmpPage}{Quaternion}
\beginscroll
The domain constructor \spadtype{Quaternion} implements quaternions over
commutative rings.
For information on related topics, see
\downlink{`Complex'}{ComplexXmpPage}\ignore{Complex} and
\downlink{`Octonion'}{OctonionXmpPage}\ignore{Octonion}.
You can also issue the system command
\spadcmd{)show Quaternion}
to display the full list of operations defined by
\spadtype{Quaternion}.

\xtc{
The basic operation for creating quaternions is
\spadfunFrom{quatern}{Quaternion}.
This is a quaternion over the rational numbers.
}{
\spadpaste{q := quatern(2/11,-8,3/4,1) \bound{q}}
```

```

}
\xtc{
The four arguments are the real part, the \spad{i} imaginary part, the
\spad{j} imaginary part, and the \spad{k} imaginary part, respectively.
}{
\spadpaste{[real q, imagI q, imagJ q, imagK q] \free{q}}
}
\xtc{
Because \spad{q} is over the rationals (and nonzero), you can invert it.
}{
\spadpaste{inv q \free{q}}
}
\xtc{
The usual arithmetic (ring) operations are available
}{
\spadpaste{q**6 \free{q}}
}
\xtc{
}{
\spadpaste{r := quatern(-2,3,23/9,-89); q + r \bound{r}\free{q}}
}
%
\xtc{
In general, multiplication is not commutative.
}{
\spadpaste{q * r - r * q \free{q r}}
}
\xtc{
There are no predefined constants for the imaginary \spad{i, j},
and \spad{k} parts, but you can easily define them.
}{
\spadpaste{i:=quatern(0,1,0,0); j:=quatern(0,0,1,0);
k:=quatern(0,0,0,1) \bound{i j k}}
}
\xtc{
These satisfy the normal identities.
}{
\spadpaste{[i*i, j*j, k*k, i*j, j*k, k*i, q*i] \free{i j k q}}
}
\xtc{
The norm is the quaternion times its conjugate.
}{
\spadpaste{norm q \free{q}}
}
\xtc{
}{
\spadpaste{conjugate q \free{q} \bound{prev}}
}
\xtc{
}{

```

```

\spadpaste{q * \% \free{q prev}}
}

\begin{page}{RadixExpansionXmpPage}{RadixExpansion}
\begin{scroll}
It is possible to expand numbers in general bases.
\labelSpace{2pc}

```

```

\xtc{
Here we expand \spad{111} in base \spad{5}.
This means
\textt{$10^2+10^1+10^0 = 4 \cdot 5^2+2 \cdot 5^1 + 5^0.$}{%
\spad{10**2+10**1+10**0 = 4*5**2+2*5**1+5**0.}}
}{
\spadpaste{111::RadixExpansion(5)}
}

\xtc{
You can expand fractions to form repeating expansions.
}{
\spadpaste{(5/24)::RadixExpansion(2)}
}
\xtc{
}{
\spadpaste{(5/24)::RadixExpansion(3)}
}
\xtc{
}{
\spadpaste{(5/24)::RadixExpansion(8)}
}
\xtc{
}{
\spadpaste{(5/24)::RadixExpansion(10)}
}
\xtc{
For bases from 11 to 36 the letters A through Z are used.
}{
\spadpaste{(5/24)::RadixExpansion(12)}
}
\xtc{
}{
\spadpaste{(5/24)::RadixExpansion(16)}
}
\xtc{
}{
\spadpaste{(5/24)::RadixExpansion(36)}
}
\xtc{
For bases greater than 36, the ragits are separated by blanks.
}{
\spadpaste{(5/24)::RadixExpansion(38)}
}
\xtc{
The \spadtype{RadixExpansion} type provides operations to obtain the
individual ragits.
Here is a rational number in base \spad{8}.
}{
\spadpaste{a := (76543/210)::RadixExpansion(8) \bound{a}}
}

```

```

}
\xtc{
The operation \spadfunFrom{wholeRagits}{RadixExpansion} returns a
list of the ragits for the integral part of the number.
}{
\spadpaste{w := wholeRagits a \free{a}\bound{w}}
}
\xtc{
The operations \spadfunFrom{prefixRagits}{RadixExpansion} and
\spadfunFrom{cycleRagits}{RadixExpansion}
return lists of the initial and repeating ragits in the
fractional part of the number.
}{
\spadpaste{f0 := prefixRagits a \free{a}\bound{f0}}
}
\xtc{
}{
\spadpaste{f1 := cycleRagits a \free{a}\bound{f1}}
}
\xtc{
You can construct any radix expansion by giving the
whole, prefix and cycle parts.
The declaration is necessary to let Axiom
know the base of the ragits.
}{
\spadpaste{u:RadixExpansion(8):=wholeRadix(w)+fractRadix(f0,f1)
\free{w f0 f1}\bound{u}}
}
\xtc{
If there is no repeating part, then the list \spad{[0]} should be used.
}{
\spadpaste{v: RadixExpansion(12) := fractRadix([1,2,3,11], [0]) \bound{v}}
}
\xtc{
If you are not interested in the repeating nature of the expansion,
an infinite stream of ragits can be obtained using
\spadfunFrom{fractRagits}{RadixExpansion}.
}{
\spadpaste{fractRagits(u) \free{u}}
}
\xtc{
Of course, it's possible to recover the fraction representation:
}{
\spadpaste{a :: Fraction(Integer) \free{a}}

RealClosure

— reclos.ht —

```
\begin{page}{RealClosureXmpPage}{RealClosure}
\beginscroll
```

The Real Closure 1.0 package provided by
Renaud Rioboo (Renaud.Rioboo@lip6.fr) consists of different
packages, categories and domains :

```
\begin{items}
\item The package \axiomType{RealPolynomialUtilitiesPackage} which
needs a \axiomType{Field} {\em F} and a
\axiomType{UnivariatePolynomialCategory} domain with coefficients in
{\em F}. It computes some simple functions such as Sturm and
Sylvester sequences
(\axiomOpFrom{sturmSequence}{RealPolynomialUtilitiesPackage},
\axiomOpFrom{sylvesterSequence}{RealPolynomialUtilitiesPackage}).

\item The category \axiomType{RealRootCharacterizationCategory}
provides abstract functions to work with "real roots" of univariate
polynomials. These resemble variables with some functionality needed
to compute important operations.

\item The category \axiomType{RealClosedField} provides common
operations available over real closed fiels. These include finding all
the roots of a univariate polynomial, taking square (and higher)
roots, ...

\item The domain \axiomType{RightOpenIntervalRootCharacterization} is
the main code that provides the functionality of
\axiomType{RealRootCharacterizationCategory} for the case of
archimedean fields. Abstract roots are encoded with a left closed
right open interval containing the root together with a defining
polynomial for the root.

\item The \axiomType{RealClosure} domain is the end-user code. It
provides usual arithmetic with real algebraic numbers, along with the
functionality of a real closed field. It also provides functions to
approximate a real algebraic number by an element of the base
field. This approximation may either be absolute
(\axiomOpFrom{approximate}{RealClosure}) or relative
(\axiomOpFrom{relativeApprox}{RealClosure}).
```

\end{items}

\centerline{CAVEATS}

Since real algebraic expressions are stored as depending on "real roots" which are managed like variables, there is an ordering on these. This ordering is dynamical in the sense that any new algebraic takes precedence over older ones. In particular every creation function raises a new "real root". This has the effect that when you type something like `\spad{sqrt(2) + sqrt(2)}` you have two new variables which happen to be equal. To avoid this name the expression such as in `\spad{s2 := sqrt(2) ; s2 + s2}`

Also note that computing times depend strongly on the ordering you implicitly provide. Please provide algebraics in the order which seems most natural to you.

\centerline{LIMITATIONS}

This packages uses algorithms which are published in [1] and [2] which are based on field arithmetics, in particular for polynomial gcd related algorithms. This can be quite slow for high degree polynomials and subresultants methods usually work best. Beta versions of the package try to use these techniques in a better way and work significantly faster. These are mostly based on unpublished algorithms and cannot be distributed. Please contact the author if you have a particular problem to solve or want to use these versions.

Be aware that approximations behave as post-processing and that all computations are done exactly. They can thus be quite time consuming when depending on several "real roots".

\newline\tab{-2}
{\em B}, a domain of category \spadtype{SetCategory}
\indent{0}\newline\tab{2}{\em Returns:}\indent{15}\tab{0}
a record object with component objects of type {\em A},...,{\em B} with
corresponding selectors {\em a},...,{\em b}
as described below.
\indent{0}\newline\tab{2}{\em Description:}\indent{15}\tab{0}
{\em Record(a:A,b:B)} is used to create the class of pairs of objects made
up of a value of type {\em A} selected by the symbol {\em a} and
a value of type {\em B} selected by the symbol {\em b}.
In general, the {\em Record} constructor can take any
number of arguments and thus can
be used to create aggregates of
heterogeneous components of arbitrary size selectable by name.
{\em Record} is a primitive domain of Axiom which cannot be
defined in the Axiom language.

3.93 regset.ht

RegularTriangularSet

— regset.ht —

```
\begin{page}{RegularTriangularSetXmpPage}{RegularTriangularSet}
\beginscroll
The \spadtype{RegularTriangularSet} domain constructor implements
regular triangular sets. These particular triangular sets were
introduced by M. Kalkbrener (1991) in his PhD Thesis under the name
regular chains. Regular chains and their related concepts are
presented in the paper "On the Theories of Triangular sets" By
P. Aubry, D. Lazard and M. Moreno Maza (to appear in the Journal of
Symbolic Computation). The \spadtype{RegularTriangularSet}
constructor also provides a new method (by the third author) for
solving polynomial system by means of regular chains. This method has
two ways of solving. One has the same specifications as Kalkbrener's
algorithm (1991) and the other is closer to Lazard's method
(Discr. App. Math, 1991). Moreover, this new method removes redundant
component from the decompositions when this is not {\em too
expensive}. This is always the case with square-free regular chains.
So if you want to obtain decompositions without redundant components
just use the \spadtype{SquareFreeRegularTriangularSet} domain
constructor or the \spadtype{LazardSetSolvingPackage} package
constructor. See also the \spadtype{LexTriangularPackage} and
\spadtype{ZeroDimensionalSolvePackage} for the case of algebraic
systems with a finite number of (complex) solutions.
```

One of the main features of regular triangular sets is that they naturally define towers of simple extensions of a field. This allows to perform with multivariate polynomials the same kind of operations as one can do in an \spadtype{EuclideanDomain}.

The \spadtype{RegularTriangularSet} constructor takes four arguments. The first one, {\bf R}, is the coefficient ring of the polynomials; it must belong to the category \spadtype{GcdDomain}. The second one, {\bf E}, is the exponent monoid of the polynomials; it must belong to the category \spadtype{OrderedAbelianMonoidSup}. the third one, {\bf V}, is the ordered set of variables; it must belong to the category \spadtype{OrderedSet}. The last one is the polynomial ring; it must belong to the category \spadtype{RecursivePolynomialCategory}(R,E,V). The abbreviation for \spadtype{RegularTriangularSet} is \spadtype{REGSET}. See also the constructor \spadtype{RegularChain} which only takes two arguments, the coefficient ring and the ordered set of variables; in that case, polynomials are necessarily built with the \spadtype{NewSparseMultivariatePolynomial} domain constructor.

We shall explain now how to use the constructor `\spadtype{REGSET}` and how to read the decomposition of a polynomial system by means of regular sets.

Let us give some examples. We start with an easy one (Donati-Traverso) in order to understand the two ways of solving polynomial systems provided by the `\spadtype{REGSET}` constructor.

```
\xctc{
Define the coefficient ring.
}{
\spadpaste{R := Integer \bound{R}}
}
\xctc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [x,y,z,t] \bound{ls}}
}
\xctc{
and make it an ordered set;
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
\xctc{
then define the exponent monoid.
}{
\spadpaste{E := IndexedExponents V \free{V} \bound{E}}
}
\xctc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
\xctc{
Let the variables be polynomial.
}{
\spadpaste{x: P := 'x \free{P} \bound{x}}
}
\xctc{
}{
\spadpaste{y: P := 'y \free{P} \bound{y}}
}
\xctc{
}{
\spadpaste{z: P := 'z \free{P} \bound{z}}
}
\xctc{
}{
\spadpaste{t: P := 't \free{P} \bound{t}}
}
\xctc{
```

Now call the `\spadtype{RegularTriangularSet}` domain constructor.

```

}{
\spadpaste{T := REGSET(R,E,V,P) \free{R} \free{E}
\free{V} \free{P} \bound{T} }
}
\xtc{
Define a polynomial system.
}{
\spadpaste{p1 := x ** 31 - x ** 6 - x - y \free{x} \free{y} \bound{p1}}
}
\xtc{
}{
\spadpaste{p2 := x ** 8 - z \free{x} \free{z} \bound{p2}}
}
\xtc{
}{
\spadpaste{p3 := x ** 10 - t \free{x} \free{t} \bound{p3}}
}
\xtc{
}{
\spadpaste{lp := [p1, p2, p3] \free{p1} \free{p2} \free{p3} \bound{lp}}
}
\xtc{
First of all, let us solve this system in the sense of Kalkbrener.
}{
\spadpaste{zeroSetSplit(lp)$T \free{lp} \free{T}}
}
\xtc{
And now in the sense of Lazard (or Wu and other authors).
}{
\spadpaste{lts := zeroSetSplit(lp,false)$T \free{lp} \free{T} \bound{lts}}
}

```

We can see that the first decomposition is a subset of the second.
So how can both be correct ?

Recall first that polynomials from a domain of the category `\spadtype{RecursivePolynomialCategory}` are regarded as univariate polynomials in their main variable. For instance the second polynomial in the first set of each decomposition has main variable `{\bf y}` and its initial (i.e. its leading coefficient w.r.t. its main variable) is `{\bf t z}`.

Now let us explain how to read the second decomposition. Note that the non-constant initials of the first set are `\texht{t^4-t}``{\bf t^4 - t}` and `\texht{$t z$}``{\bf t z}`. Then the solutions described by this first set are the common zeros of its polynomials that do not cancel the polynomials `\texht{t^4-t}``{\bf t^4 - t}` and `\texht{$t z$}``{\bf t z}`.

Now the solutions of the input system `{\bf lp}`

satisfying these equations are described by the second and the third sets of the decomposition. Thus, in some sense, they can be considered as degenerated solutions. The solutions given by the first set are called the generic points of the system; they give the general form of the solutions. The first decomposition only provides these generic points. This latter decomposition is useful when they are many degenerated solutions (which is sometimes hard to compute) and when one is only interested in general informations, like the dimension of the input system.

```
\xctc{
We can get the dimensions of each component
of a decomposition as follows.
}{
\spadpaste{[coHeight(ts) for ts in lts] \free{lts}}
}
```

Thus the first set has dimension one.
Indeed $\{t\}$ can take any value, except $\{0\}$
or any third root of $\{1\}$, whereas $\{z\}$
is completely determined from $\{t\}$,
 $\{y\}$ is given by $\{z\}$ and $\{t\}$,
and finally $\{x\}$ is given by the other three variables.
In the second and the third sets of the second decomposition
the four variables are completely determined and thus
these sets have dimension zero.

We give now the precise specifications of each decomposition.
This assume some mathematical knowledge.
However, for the non-expert user, the above explanations will
be sufficient to understand the other features of the
`\spadtype{RSEGSET}` constructor.

The input system $\{lp\}$ is decomposed in the sense
of Kalkbrener as finitely many regular sets $\{T_1, \dots, T_s\}$
such that the radical ideal generated by $\{lp\}$
is the intersection of the radicals of the
saturated ideals of $\{T_1, \dots, T_s\}$.
In other words, the affine variety associated with $\{lp\}$
is the union of the closures (w.r.t. Zarisky topology)
of the regular-zeros sets of $\{T_1, \dots, T_s\}$.

N. B. The prime ideals associated with the
radical of the saturated ideal of
a regular triangular set have all the same dimension;
moreover these prime ideals can be given by characteristic
sets with the same main variables.
Thus a decomposition in the sense of Kalkbrener
is unmixed dimensional.
Then it can be viewed as a *lazy*

decomposition into prime ideals (some of these prime ideals being merged into unmixed dimensional ideals).

Now we explain the other way of solving by means of regular triangular sets.

The input system $\{\mathbf{lp}\}$ is decomposed in the sense of Lazard as finitely many regular triangular sets $\{\mathbf{T_1}, \dots, \mathbf{T_s}\}$ such that the affine variety associated with $\{\mathbf{lp}\}$ is the union of the regular-zeros sets of $\{\mathbf{T_1}, \dots, \mathbf{T_s}\}$. Thus a decomposition in the sense of Lazard is also a decomposition in the sense of Kalkbrener; the converse is false as we have seen before.

When the input system has a finite number of solutions, both ways of solving provide similar decompositions as we shall see with this second example (Caprasse).

```
\xtc{
Define a polynomial system.
}{
\spadpaste{f1 := y**2*z+2*x*y*t-2*x-z \free{z} \free{x}
\free{y} \free{t} \bound{f1}}
}
\xtc{
}{
\spadpaste{f2 := -x**3*z+ 4*x*y**2*z+ 4*x**2*y*t+ 2*y**3*t+
4*x**2- 10*y**2+ 4*x*z- 10*y*t+ 2 \free{z} \free{x} \free{y}
\free{t} \bound{f2}}
}
\xtc{
}{
\spadpaste{f3 := 2*y*z*t+x*t**2-x-2*z \free{z} \free{x} \free{y}
\free{t} \bound{f3}}
}
\xtc{
}{
\spadpaste{f4 := -x*z**3+ 4*y*z**2*t+ 4*x*z*t**2+ 2*y*t**3+
4*x*z+ 4*z**2-10*y*t- 10*t**2+2 \free{z} \free{x} \free{y}
\free{t} \bound{f4}}
}
\xtc{
}{
\spadpaste{lf := [f1, f2, f3, f4] \free{f1} \free{f2}
\free{f3} \free{f4} \bound{lf}}
}

\xtc{
First of all, let us solve this system in the sense of Kalkbrener.
}
```

```

\spadpaste{zeroSetSplit(lf)$T \free{lf} \free{T}}
}
\xtc{
And now in the sense of Lazard (or Wu and other authors).
}{
\spadpaste{lts2 := zeroSetSplit(lf,false)$T \free{lf}
\free{T} \bound{lts2}}
}

```

Up to the ordering of the components, both decompositions are identical.

```

\xtc{
Let us check that each component has a finite number of solutions.
}{
\spadpaste{[coHeight(ts) for ts in lts2] \free{lts2}}
}

```

```

\xtc{
Let us count the degrees of each component,
}{
\spadpaste{degrees := [degree(ts) for ts in lts2]
\free{lts2} \bound{degrees}}
}
\xtc{
and compute their sum.
}{
\spadpaste{reduce(+,degrees) \free{degrees}}
}

```

We study now the options of the `\spadfun{zeroSetSplit}` operation. As we have seen yet, there is an optional second argument which is a boolean value. If this value is true (this is the default) then the decomposition is computed in the sense of Kalkbrener, otherwise it is computed in the sense of Lazard.

There is a second boolean optional argument that can be used (in that case the first optional argument must be present). This second option allows you to get some information during the computations.

Therefore, we need to understand a little what is going on during the computations. An important feature of the algorithm is that the intermediate computations are managed in some sense like the processes of a Unix system. Indeed, each intermediate computation may generate other intermediate computations and the management of all these computations is a crucial task for the efficiency. Thus any intermediate computation may be suspended, killed or resumed, depending on algebraic considerations that determine priorities for

these processes. The goal is of course to go as fast as possible towards the final decomposition which means to avoid as much as possible unnecessary computations.

To follow the computations, one needs to set to `\spad{true}` the second argument. Then a lot of numbers and letters are displayed. Between a `\spad{[]}` and a `\spad{[]}` one has the state of the processes at a given time. Just after `\spad{[]}` one can see the number of processes. Then each process is represented by two numbers between `\spad{<}` and `\spad{>}`. A process consists of a list of polynomial `{\bf ps}` and a triangular set `{\bf ts}`; its goal is to compute the common zeros of `{\bf ps}` that belong to the regular-zeros set of `{\bf ts}`. After the processes, the number between pipes gives the total number of polynomials in all the sets `\spad{ps}`. Finally, the number between braces gives the number of components of a decomposition that are already computed. This number may decrease.

Let us take a third example (Czapor-Geddes-Wang) to see how these informations are displayed.

```
\xctc{
Define a polynomial system.
}{
\spadpaste{u : R := 2 \free{R} \bound{u}}
}
\xctc{
}{
\spadpaste{q1 := 2*(u-1)**2+ 2*(x-z*x+z**2)+ y**2*(x-1)**2-
2*u*x+ 2*y*t*(1-x)*(x-z)+ 2*u*z*t*(t-y)+ u**2*t**2*(1-2*z)+
2*u*t**2*(z-x)+ 2*u*t*y*(z-1)+ 2*u*z*x*(y+1)+
(u**2-2*u)*z**2*t**2+ 2*u**2*z**2+ 4*u*(1-u)*z+ t**2*(z-x)**2
\free{z} \free{x} \free{y} \free{t} \free{u} \bound{q1}}
}
\xctc{
}{
\spadpaste{q2 := t*(2*z+1)*(x-z)+ y*(z+2)*(1-x)+ u*(u-2)*t+
u*(1-2*u)*z*t+ u*y*(x+u-z*x-1)+ u*(u+1)*z**2*t \free{z}
\free{x} \free{y} \free{t} \free{u} \bound{q2}}
}
\xctc{
}{
\spadpaste{q3 := -u**2*(z-1)**2+ 2*z*(z-x)-2*(x-1) \free{z}
\free{x} \free{y} \free{t} \free{u} \bound{q3}}
}
\xctc{
}{
\spadpaste{q4 := u**2+4*(z-x**2)+3*y**2*(x-1)**2-
3*t**2*(z-x)**2 +3*u**2*t**2*(z-1)**2+u**2*z**2*(z-2)+
6*u*t*y*(z+x+z*x-1) \free{z} \free{x} \free{y} \free{t}
\free{u} \bound{q4}}
```

```

}
\xtc{
}{
\spadpaste{lq := [q1, q2, q3, q4] \free{q1} \free{q2}
\free{q3} \free{q4} \bound{lq}}
}

\xtc{
Let us try the information option.
N.B. The timing should be between 1 and 10 minutes, depending on your machine.
}{
\spadpaste{zeroSetSplit(lq,true,true)$T \free{lq} \free{T}}
}

```

Between a sequence of processes, thus between a `\spad{[]}` and a `\spad{[]}` you can see capital letters `\spad{W, G, I}` and lower case letters `\spad{i, w}`. Each time a capital letter appears a non-trivial computation has be performed and its result is put in a hash-table. Each time a lower case letter appears a needed result has been found in an hash-table. The use of these hash-tables generally speed up the computations. However, on very large systems, it may happen that these hash-tables become too big to be handle by your Axiom configuration. Then in these exceptional cases, you may prefer getting a result (even if it takes a long time) than getting nothing. Hence you need to know how to prevent the `\spadtype{RSEGSET}` constructor from using these hash-tables. In that case you will be using the `\spadfun{zeroSetSplit}` with five arguments. The first one is the input system `{\bf lp}` as above. The second one is a boolean value `\spad{hash?}` which is `\spad{true}` iff you want to use hash-tables. The third one is boolean value `\spad{clos?}` which is `\spad{true}` iff you want to solve your system in the sense of Kalkbrener, the other way remaining that of Lazard. The fourth argument is boolean value `\spad{info?}` which is `\spad{true}` iff you want to display information during the computations. The last one is boolean value `\spad{prep?}` which is `\spad{true}` iff you want to use some heuristics that are performed on the input system before starting the real algorithm. The value of this flag is `\spad{true}` when you are using `\spadfun{zeroSetSplit}` with less than five arguments. Note that there is no available signature for `\spadfun{zeroSetSplit}` with four arguments.

We finish this section by some remarks about both ways of solving, in the sense of Kalkbrener or in the sense of Lazard. For problems with a finite number of solutions, there are theoretically equivalent and the resulting decompositions are identical, up to the ordering of the components. However, when solving in the sense of Lazard, the algorithm behaves differently. In that case, it becomes more incremental than in the sense of Kalkbrener. That means the polynomials of the input system are considered one after another whereas in the sense of Kalkbrener the input system is treated more

globally.

This makes an important difference in positive dimension. Indeed when solving in the sense of Kalkbrener, the {\em Primeidealkettensatz} of Krull is used. That means any regular triangular containing more polynomials than the input system can be deleted. This is not possible when solving in the sense of Lazard. This explains why Kalkbrener's decompositions usually contain less components than those of Lazard. However, it may happen with some examples that the incremental process (that cannot be used when solving in the sense of Kalkbrener) provide a more efficient way of solving than the global one even if the {\em Primeidealkettensatz} is used. Thus just try both, with the various options, before concluding that you cannot solve your favorite system with \spadfun{zeroSetSplit}. There exist more options at the development level that are not currently available in this public version. So you are welcome to contact {\em marc@nag.co.uk} for more information and help.

3.94 roman.ht

RomanNumeral

← “Axiom Number Types” (NumberPage) [3.80](#) on page [1021](#)
 — roman.ht —

```
\begin{page}{RomanNumeralXmpPage}{RomanNumeral}
\beginscroll
The Roman numeral package was added to Axiom in MCMLXXXVI
for use in denoting higher order derivatives.

\xtc{
For example, let \spad{f} be a symbolic operator.
}{
\spadpaste{f := operator 'f \bound{f}}
}
\xtc{
This is the seventh derivative of \spad{f} with respect to \spad{x}.
}{
\spadpaste{D(f x,x,7) \free{f}}
}
\xtc{
You can have integers printed as Roman numerals by declaring variables to
be of type \spadtype{RomanNumeral} (abbreviation \spadtype{ROMAN}).
}{
\spadpaste{a := roman(1978 - 1965) \bound{a}}
```

}

This package now has a small but devoted group of followers that claim this domain has shown its efficacy in many other contexts. They claim that Roman numerals are every bit as useful as ordinary integers.

\xctc{

In a sense, they are correct, because Roman numerals form a ring and you can therefore construct polynomials with Roman numeral coefficients, matrices over Roman numerals, etc..

}{

\spadpaste{x : UTS(ROMAN,'x,0) := x \bound{x}}

}

\xctc{

Was Fibonacci Italian or ROMAN?

}{

\spadpaste{recip(1 - x - x**2) \free{x}}

}

\xctc{

You can also construct fractions with Roman numeral numerators and denominators, as this matrix Hilberticus illustrates.

}{

\spadpaste{m : MATRIX FRAC ROMAN \bound{m}}

}

\xctc{

}{

\spadpaste{m := matrix [[1/(i + j) for i in 1..3] for j in 1..3]

\free{m} \bound{m1}}

}

\xctc{

Note that the inverse of the matrix has integral \spadtype{ROMAN} entries.

}{

\spadpaste{inverse m \free{m1}}

}

\xctc{

Unfortunately, the spoil-sports say that the fun stops when the numbers get big---mostly because the Romans didn't establish conventions about representing very large numbers.

}{

\spadpaste{y := factorial 10 \bound{y}}

}

\xctc{

You work it out!

}{

\spadpaste{roman y \free{y}}

}

Issue the system command

\spadcmd{show RomanNumeral}

```

to display the full list of operations defined by
\spadtype{RomanNumeral}.

Segment

⇒ “notitle” (SegmentBindingXmpPage) 3.96 on page 1224

⇒ “notitle” (UniversalSegmentXmpPage) [3.111](#) on page 1322

— **seg.ht** —

```
\begin{page}{SegmentXmpPage}{Segment}
\beginscroll
```

The `\spadtype{Segment}` domain provides a generalized interval type.

```
\labelSpace{2pc}
\xtc{
Segments are created using the \spadSyntax{...} construct
by indicating the (included) end points.
}{
\spadpaste{s := 3..10 \bound{s}}
}
\xtc{
The first end point is called the \spadfunFrom{lo}{Segment}
and the second is called \spadfunFrom{hi}{Segment}.
}{
\spadpaste{lo s \free{s}}
}
\xtc{
These names are used even though the end points might belong to an
unordered set.
}{
\spadpaste{hi s \free{s}}
}

\xtc{
In addition to the end points, each segment has an integer ‘‘increment.’’
An increment can be specified using the ‘‘\spad{by}’’ construct.
\spadkey{by}
}{
\spadpaste{t := 10..3 by -2 \bound{t}}
}
\xtc{
This part can be obtained using the \spadfunFrom{incr}{Segment}
function.
}{
\spadpaste{incr s \free{s}}
}
\xtc{
Unless otherwise specified, the increment is \spad{1}.
}{
\spadpaste{incr t \free{t}}
}

\xtc{
A single value can be converted to a segment with equal end points.
This happens if segments and single values are mixed in a list.
```

```

}{
\spadpaste{l := [1..3, 5, 9, 15..11 by -1] \bound{l}}
}

\xtc{
If the underlying type is an ordered ring, it is possible to perform
additional operations.
The \spadfunFrom{expand}{Segment} operation creates a list of
points in a segment.
}{
\spadpaste{expand s \free{s}}
}
\xtc{
If \spad{k > 0}, then \spad{expand(1..h by k)} creates the list
\spad{[1, 1+k, ..., 1N]} where \spad{1N <= h < 1N+k}.
If \spad{k < 0}, then \spad{1N >= h > 1N+k}.
}{
\spadpaste{expand t \free{t}}
}

\xtc{
It is also possible to expand a list of segments. This is equivalent
to appending lists obtained by expanding each segment individually.
}{
\spadpaste{expand l \free{l}}
}

3.97 set.ht

Set

⇒ “notitle” (ListXmpPage) [3.64](#) on page 866

— set.ht —

```

\begin{page}{SetXmpPage}{Set}
\beginscroll

```

The `\spadtype{Set}` domain allows one to represent explicit finite sets of values.

These are similar to lists, but duplicate elements are not allowed.

```
\xctc{
```

Sets can be created by giving a fixed set of values `\ldots`

```
{
```

```
\spadpaste{s := set [x**2-1, y**2-1, z**2-1] \bound{s}}
```

```
}
```

```
\xctc{
```

or by using a collect form, just as for lists.

In either case, the set is formed from a finite collection of values.

```
{
```

```
\spadpaste{t := set [x**i - i+1 for i in 2..10 | prime? i] \bound{t}}
```

```
}
```

```
\xctc{
```

The basic operations on sets are

```
\spadfunFrom{intersect}{Set}, \spadfunFrom{union}{Set},
```

```
\spadfunFrom{difference}{Set},
```

```
and \spadfunFrom{symmetricDifference}{Set}.
```

```
{
```

```
\spadpaste{i := intersect(s,t) \free{s t}\bound{i}}
```

```
}
```

```
\xctc{
```

```
{
```

```

\spadpaste{u := union(s,t)          \free{s t}\bound{u}}
}
\xtc{
The set \spad{difference(s,t)} contains those members of \spad{s} which
are not in \spad{t}.
}{
\spadpaste{difference(s,t)          \free{s t}}
}
\xtc{
The set \spad{symmetricDifference(s,t)} contains those elements which are
in \spad{s} or \spad{t} but not in both.
}{
\spadpaste{symmetricDifference(s,t)    \free{s t}}
}

\xtc{
Set membership is tested using the \spadfunFrom{member?}{Set} operation.
}{
\spadpaste{member?(y, s)            \free{s}}
}
\xtc{
}{
\spadpaste{member?((y+1)*(y-1), s)    \free{s}}
}
\xtc{
The \spadfunFrom{subset?}{Set} function determines whether one set
is a subset of another.
}{
\spadpaste{subset?(i, s)            \free{i s}}
}
\xtc{
}{
\spadpaste{subset?(u, s)            \free{u s}}
}

\xtc{
When the base type is finite, the absolute complement of a set is
defined.
This finds the set of all multiplicative generators of
\spadtype{PrimeField 11}---the integers mod \spad{11.}
}{
\spadpaste{gs := set [g for i in 1..11 | primitive?(g := i::PF 11)]
\bound{gs}}
}
\xtc{
The following values are not generators.
}{
\spadpaste{complement gs \free{gs}}
}

```

Often the members of a set are computed individually; in addition, values can be inserted or removed from a set over the course of a computation.

```
\xctc{
There are two ways to do this:
}{
\spadpaste{a := set [i**2 for i in 1..5] \bound{a}}
}
\xctc{
One is to view a set as a data structure and to apply updating
operations.
}{
\spadpaste{insert!(32, a) \free{a}\bound{ainsert}}
}
\xctc{
}{
\spadpaste{remove!(25, a) \free{a}\bound{aremove}}
}
\xctc{
}{
\spadpaste{a \free{aremove} ainsert}}
}
\xctc{
The other way is to view a set as a mathematical entity and to
create new sets from old.
}{
\spadpaste{b := b0 := set [i**2 for i in 1..5] \bound{b}}
}
\xctc{
}{
\spadpaste{b := union(b, {32})          \free{b}\bound{binsert}}
}
\xctc{
}{
\spadpaste{b := difference(b, {25})     \free{binsert}\bound{bremove}}
}
\xctc{
}{
\spadpaste{b0 \free{bremove}}
}
